Models

NOTICE: PUMP SYSTEM PRIMING REQUIRED BEFORE OPERATION

Before you operate your Rescue 17's water cannon, you'll need to prime the pump system. This simple process can be done right at the pond if necessary. (You can also use this same technique with vegetable oil for long term storage.)

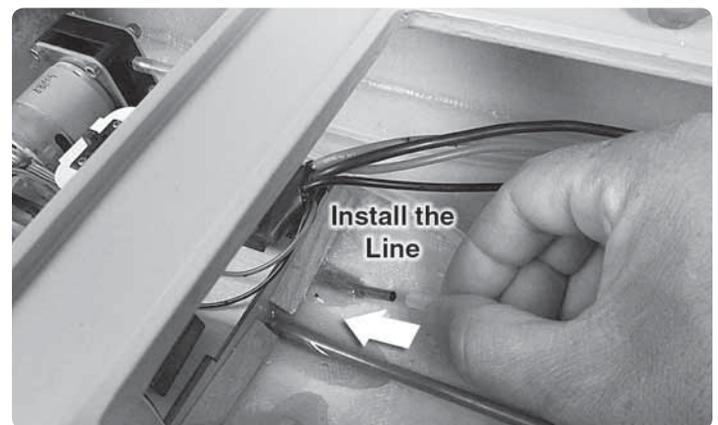

1. Remove the water line between the water pick up tube and water pump.

2. Fully submerge the line in water. Pinch the end closed as you remove the line from the water.

3. Install the open end of the line back onto the pump. Then, soften your grip on the pinched end of the line. The water in the line will go into the pump to provide the prime.

4. Install the open end of the line back onto the pickup.

5. You are now ready to operate the pump.

NOTE: The water cannon pickup intentionally faces rearward to help prevent contaminants from entering the pump. If you run the boat at full speed forward, the pump may not pick up a prime. Reduce speed to regain a prime.
