Specifications

**Displacement:** 170cc [10.37 cu. in.]

**Performance:** 17.5 HP / 9,000 RPM

**Idle speed:** 1,100 RPM

**Ignition Style:** Electronic Ignition

**Recommended Propellers:** 30×12, 32×10

**Spark Plug Type:** CM6

(Gap) 0.018 in. – 0.020 in. [0.45 mm – 0.51 mm]

**Diameter x Stroke:** 2.06 in. [52mm] × 1.19 in. [30 mm]

**Compression Ratio:** 9.5:1

**Carburetor:** (1) DLE with Manual Choke

**Weight:**
- Main Engine – 7.83lbs [3,552 g]
- Mufflers (2) – 13.8 oz [391 g]
- Electronic Ignition (1) – 5.2 oz [148 g]
- Engine Mount Standoffs (4) – 1.4 oz [41g]

**Fuel:** 87–93 Octane Gasoline with a 30:1 gas/2-stroke (2-cycle) oil mixture
Parts List

(1) DLE-170cc Gas Engine w/ DLE carburetor
(2) DLE (CM-6 size) Spark plugs
(2) Mufflers w/(2) gaskets
(4) 5x20mm SHCS (muffler mounting)
(1) Electronic Ignition Module w/additional tachometer lead
(4) 20mm Engine Mounting Standoffs
(6) 6x55mm SHCS with 6mm lock washers & 6mm flat washers (propeller mounting)
(2) Silicone Pick-up Wire Cover/Ignition Wire Cover
(1) Red Three Pin Connector Lead w/ Pig Tail (ignition switch)
(2) Three Pin Connector Securing Clips
(1) DLE-170 Decal Sheet
(2) Brass Pressure Fittings (smoke system use/not included)

Safety Tips and Warnings

- This engine is not a toy. Please place your safety and the safety of others paramount while operating. DLE will not be held responsible for any safety issues or accidents involving this engine.
- Operate the engine in a properly ventilated area.
- Before starting the engine, please make sure all components including the propeller and the engine mount are secure and tight. It is strongly recommended that a screw sealant is used (Great Planes Threadlocker GPMR6060) during engine installation.
- During the break-in period, it is recommended that the engine be installed on the aircraft or a test stand with an appropriate shock
absorber. Otherwise it is probable that vibration could rebound back to the engine and serious damages may occur during the break-in period.

- For your safety and the safety of others, please do not stand in front or in line with the propeller when the engine is running. Keep onlookers away from the running engine, especially small children.

- Always use a balanced spinner and a balanced propeller. An unbalanced spinner and/or propeller combination will cause high levels of vibration and may cause the propeller shaft to break. Always use a high-quality lightweight spinner on your engine. Lightweight spinners are considered to be those with a cone wall of 1mm or less. Heavy spinners could cause the propeller shaft to break. Securely tighten the spinner and propeller on the engine to prevent them from being thrown off while running.

- Never use a propeller that has impacted the ground. Even though it may look good from the outside, it may have internal damage which could cause it to disintegrate while in use. Do not use a nicked, cracked or split propeller.

- Keep foreign objects away from the propeller. Make sure that nothing can be “sucked in” by the propeller.

- Never start the engine on loose gravel or sand.

- Do not attempt to stop the engine by throwing anything into the path of the propeller.

- Make sure the fuel line is well-secured to the engine and to the fuel tank so that it won’t come off in flight.

- Do not use silicone fuel line because it will be dissolved by the fuel. Use only gasoline approved rubber fuel line. Always secure the fuel line away from the cylinder head. The engine’s heat can damage the fuel line.

- Never touch the engine or muffler immediately after a run. The engine will be hot.

- Before transporting your model, remove all the fuel from the fuel tank and fuel lines.

- Always use high-quality oil intended for 2-stroke (2-cycle) engines. It’s a good idea to use a petroleum-based 2-cycle motor oil like Lawn Boy All Season - Ashless, Generation II oil for the break-in period. Break-in should be considered about the first 3-5 gallons you run in the engine. A high quality synthetic 2-cycle oil is recommended for optimum performance and a longer engine life. Synthetic 2-cycle oils leave fewer combustion byproducts than natural oils, which can foul the engine and exhaust ports, resulting in reduced performance. Synthetic oils also better reduce friction and provide more fluidity at low temperatures.
For optimum performance please use fresh or recently purchased 87 octane gasoline with a 30:1 gas/oil mixture.

**GAS/OIL Mixing Guide**

1 Gallon Gasoline (128 fl oz/3.78L)/2-Cycle Oil (4.26 fl oz/125.68ml) = 30:1 ratio

- Always install an ignition system kill switch on the aircraft used.
- Do not install your throttle servo or kill switch servo inside the engine compartment. Doing so could cause radio interference. Install all electronic radio devices at least 12" [305mm] away from the engine.
- The throttle and choke pushrods should be non-metallic.
- If the engine is not to be used for more than a month, drain the fuel tank and remove any fuel from inside the carburetor. Do this by running the engine at idle until it quits by running out of fuel. Keeping gasoline inside the carburetor over an extended period of time will damage the diaphragm valve and clog passages inside the carburetor. Due to the carburetor being more complicated than those used in glow engines, keep the fuel clean by using an on-board fuel filter. Use a filter intended to be used with gasoline engines. Metal filters intended for glow engine are too coarse and will not screen out finer particles.
- Always filter your fuel by using an appropriate filter before putting it into the airplane’s fuel tank.
- Gasoline is extremely flammable. Keep it away from an open flame, excessive heat or sources of sparks.
- Do not smoke near the engine or the fuel tank.
- This engine was designed for use in a model aircraft. Do not attempt to use it for any other purpose.
- **Caution:** Running the engine with a lean gas mixture will cause the engine to overheat and burn the electrode of the spark plug. Pay close attention to the High-speed Needle adjustment. Running the engine with the proper gas mixture will cause the spark plugs to appear slightly yellow at the ignition point.
- Excessive running of the engine at idle speed can result in seriously carbonized spark plugs.
- Keep the surface of the engine clean to ensure proper heat dissipation. Ensure proper cooling/ventilation around both cylinders with adequate air exhaust. A 1:3 ratio of air intake to air exhaust is recommended for proper engine cooling.
To avoid permanent damage to the electronic ignition system, **NEVER** rotate the propeller on your DLE engine with the electronic ignition system switched on and the plugs not installed in the plug caps.

If you elect to not use a smoke system with your engine and aircraft, the two included brass fittings must be installed in the muffler and then obstructed to prevent exhaust from leaking into the cowling. To do this use two short segments of neoprene fuel line and two (GPMQ4166) fuel-line plugs (not included).

### Installation Instructions

#### Prepare the Engine for Installation

Before beginning installation, it’s a good idea to plan the location of the various components of the engine. Many of the following steps may need to be completed in a different order than listed.

1. Check to see that all screws and bolts are tight. Check carefully for any cracks, broken or missing parts. Tighten or replace any damaged or missing parts before proceeding.

2. Install the silicone wire cover over the pick up lead coming from the engine (cut the excess silicon wire covers) and connect the lead to the pick–up lead from the Electronic Ignition Module. Secure the connection with the included three pin connector securing clip.
3. Connect the ignition kill switch lead to the red connector from the ignition control module using the lead from the kill switch or with the included three pin connector with pig tail. Use the included three pin securing clip to secure the connection.

4. Connect the ignition module battery to the kill switch. Any 4.8-6.0V, 1000mAh and above capacity battery will work well for this. Use heat shrink tubing to secure this connection.

5. Install the silicone ignition wire cover over the ignition wires to the spark plugs.

6. Install the spark plugs into the engine cylinders (7-8lbs Torque).
7. Use the above diagram to install the Electronic Ignition Module to the engine.

8. Install a 2-56 ball links (not included) to the throttle & choke control arms. Use a 2-56 lock nut to secure the ball links or use (2) 2-56 nuts and thread locker to secure the links. Once the links are secure, exercise the throttle and choke levers to ensure that no binding occurs.
**Installing the DLE-170 on Your Airplane**

**Note:** The DLE-170 must be installed on at least a 3/8” [9.5mm] firewall. The firewall must be securely glued to the airplane. Use triangle stock and pin the firewall with hardwood dowels to reinforce the firewall glue joints. Never install the DLE-170 onto a firewall thinner than specified because it may fail due to the power of the engine.

**Note:** The distance from the firewall to the propeller washer is 8.34” [212mm].

1. Use the supplied template (on the back cover of this manual) to drill the engine mounting bolt holes.

2. Install (4) 6mm blind nuts or tee nuts (not included) into the back side (non-engine side) of the firewall. Install the engine to the firewall using (4) 6x45mm SHCS with 6mm lock washers and flat washers (not included) with the included standoffs. Use some threadlocking compound, such as Great Planes® Pro™ Threadlocker (GPMR6060) on the screws where the threads enter the blind nuts.

3. Install the fuel tank in the airframe. Use only gasoline-safe fuel lines and a gasoline safe stopper.
One line should go to the carburetor via a gasoline approved T-fitting and the other is to be used as a vent (a vent line is simply an open ended fuel line from the fuel tank which exits the engine compartment or the fuselage, most vent lines exit at the bottom of the firewall). You can fill the tank by using the carburetor line as fill line if you have access to it or install a third line to be used as fill line. Installing a third line is the cleanest and easiest way to add fuel. Be sure to use a filler plug with either a 2-line or 3-line set-up. It’s a good idea to add an extension to the vent line as shown, that goes up and to the rear of the tank. This helps to avoid draining fuel from the tank when the model is pointed down.

4. Install the ignition kill switch on the aircraft so that it is easily accessible from the outside of the plane.

5. Install the throttle servo and choke servos at least 12” [305mm] away from the engine. Make sure that you get the throttle and choke’s full range of rotation with your servos travel. Be sure to use a non-metallic linkage for both the throttle and choke linkage. A high-torque heavy duty metal gear servo is recommended to operate the throttle on the DLE-170. (Components for the non-metallic linkage can be purchased through your local hobby shop.)

6. Install the ignition module securely in the airplane forward area. It is recommended that a thin piece of foam rubber is placed between the module and the mounting surface, and that Velcro™ is used to hold the module in place.

7. Secure any unsecure connections with heat shrink tubing (Not included).
8. Connect the ignition wires from ignition module to the spark plugs.

9. Install the mufflers onto the engine with the included gaskets. Tighten the two bolts on each muffler evenly to ensure a proper seal. Be sure to use thread locker.

10. Cut all necessary clearance, carburetor adjustment, cooling, and exhaust holes in the cowl. A 1:3 ratio of air intake-to-air exhaust area is recommended for proper engine cooling.

11. Make sure the cowl is secured to the airplane and that the spinner to cowl clearance is at least 1/8" [3.2mm].

Drill and Install the Propeller

The easiest way to drill the propeller to fit the hub is to use a drill guide. If you do not have a drill guide, you can use the following method to drill your propellers.

1. Remove the cowling from the aircraft. Use the included propeller washer to mark the centering hole on the propeller.

2. Once the location is established, use a drill press with a 13/32" (0.406/10.31mm) drill bit. In order to achieve a clean hole opening on both sides of the propeller, drill only half way through the propeller with the 13/32" (0.406/10.31mm) drill bit. Then flip the propeller over and drill completely through the hole.

3. Next, set the engine near the beginning of the compression stroke. Note the position of the ignition magnet with engine inverted.

4. Place the propeller on the crankshaft at the one o’clock position.
5. Mark the location of one of the outer holes on the propeller. Use a GPM Dead Center Hole Locator (GPMR8130) to center and start the hole.

6. Remove the propeller from the engine and drill the outer hole on the drill press using a #35 (.110”/2.81mm) drill bit as a pilot hole. Next use a 1/4" (6.28mm) drill bit to finish the hole. In order to achieve a clean finish on both sides of the propeller drill only half way through the propeller and drill completely through the hole.

7. Use one of the 6×55mm SHCS with 6mm lock washers and flat washers to align the propeller washer on the propeller and use the Dead Center Hole Locator to mark the position of the remaining holes.

8. Drill the remaining five holes in the propeller using the same technique on step 6.

9. Mount the propeller to the engine using the 6×55mm SHCS with 6mm lock washers and flat washers. Be sure to use threadlocker.

**Adjustment of the Engine**

Each DLE-170 has been factory preset. However, higher elevations will influence the performance of the carburetor. To obtain optimum output of the engine slight adjustment of the carburetor may be necessary.

**Engine Functions & Adjustments**

1. Choke Control (the choke control should be used when the engine is cold)
2. Throttle
3. Idle Adjustment Screw (adjust the idle speed)
4. (H) High-speed Needle (adjusts the fuel/air mixture at high speeds)
5. (L) Low-speed Needles (adjusts the fuel/air mixture at low speeds)
Idle Adjustment
Turning the Idle Adjustment Screw (No.3) clockwise will increase the idle speed. Turning the Idle Screw counter-clockwise will decrease the idle speed.

Low Speed Needle Adjustment
Turning the Low-speed Needle (No.5) clockwise will lean the fuel/air mixture at low speeds. Turning the Low-speed Needle (No.5) counter-clockwise will richen the fuel/air mixture at low speeds. (The default or factory setting of the Low-speed Needle is as follows; turn the needle to the fully stop/closed position and then turn back 1.5 turns).

High Speed Needle Adjustment
Turning the High-speed Needle (No.5) clockwise will lean the fuel/air mixture at high speeds. Turning the low-speed Needle (No.5) counter-clockwise will richen the fuel/air mixture at high speeds. (The default or factory setting of the High-speed Needle is as follows; turn the needle to the fully stop/closed position and then open the needle 1.25-1.5 turns). It is recommended that the High-speed needle be adjusted by the use of a tachometer to obtain maximum speed. Smooth acceleration and deceleration is an indicator of proper engine performance.

Ignition Timing Adjustment
The ignition timing is preset on the DLE-170 at 43° before top dead center (TDC). The ignition timing can be advanced or retarded by loosening the (2) ignition sensor Phillips head screws and sliding the sensor to the full extent clockwise (44° advancing the ignition) or counter clockwise (42° retarding the ignition). Be sure to retighten the Phillips head screws after adjusting the ignition timing.

Advancing the timing causes combustion to occur earlier resulting in higher performance of the engine. However, advancing the timing also causes higher engine temperatures and can cause premature wear of internal engine components.

Carburetor Adjustment Troubleshooting

Problem:
If The engine hesitates when accelerated rapidly.
or The rpm increases at idling.
or The engine stops when the throttle is moved from high to low.

Solution:
The low-speed needle “L” is too lean. Open it up about 1/8 of a turn and try again.
Problem: 
 If the idle is not steady.

Solution: 
The low-speed needle “L” valve is too rich. Close it 1/8 of a turn and try again.

Problem: 
If engine stops at full throttle.  
or Engine hesitates when accelerated rapidly.  
or The engine will not come up to full rpm at full throttle.

Solution: 
The high-speed needle valve “H” is too lean. Open it up 1/8 of a turn and try again.

Problem: 
If your engine does not reach full rpm.  
or Carbon build-ups appear consistently on your spark plug.

Solution: 
The high-speed needle valve “H” is too rich. Close it up 1/8 turn and try again.

Starting Procedures

If starting the engine the first time and during break-in it’s recommended that you run the engine without the cowling. Also for safety reasons do not make adjustments to the carburetor while the engine is running.

There are two recommended ways to start the DLE-170.

A. Manual Starting

Note: When hand starting the DLE-170, use a thick glove or heavy duty starter stick to protect your hand.

1. The propeller should be installed on the drive washer at the one o’clock position and near the beginning of the compression stroke so that it’s comfortable to flip it through compression.

2. Have someone help you hold the airplane while you start the engine.

3. Close the choke on the carburetor and open the throttle slightly from the idle position.

4. Switch the ignition switch to ON.

5. Flip the propeller counter clockwise several times briskly, until a popping sound is heard. This indicates that the engine is firing.
6. Move the choke lever to the OPEN position.
7. Set the throttle to a high idle. Set the propeller so that it is near the beginning of the compression stroke.
8. Flip the propeller through compression rapidly. If this is done properly, the engine will start after several brisk flips of the prop.
9. After starting, let the engine idle for 30 to 45 seconds. Open and close the throttle slowly until the engine runs smoothly at idle and at full throttle. Acceleration should also be smooth. If acceleration is not smooth, adjustments to the carburetor may be necessary (see Adjustments of the Engine pages 11-13).
10. If your engine does not start, repeat the procedure.

B. Electric Starter Starting

A 24V electric starter is recommended to start the DLE-170.

1. Make sure you use a good quality, lightweight aluminum spinner.
2. Have someone help you hold the airplane while you start it.
3. Close the choke on the carburetor and open the throttle slightly from the idle position.
4. Switch the ignition to ON and use the electric starter to turn the engine through compression until a popping sound is heard. This indicates that the engine is firing.
5. Open the choke.
6. Set the throttle to high idle and use your electric starter to turn over the engine until it starts.
7. After starting, let the engine idle for 30 to 45 seconds. Open and close the throttle slowly until the engine runs smoothly at idle and at full throttle. Acceleration should also be smooth. If acceleration is not smooth, adjustments to the carburetor may be necessary (see Adjustments of the Engine on pages 11–13).
8. If your engine does not start, repeat the procedure.

Engine Troubleshooting

If your engine fails to start after the starting procedures please check the following.
### Symptom Diagnosis Fix

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Diagnosis</th>
<th>Fix</th>
</tr>
</thead>
<tbody>
<tr>
<td>Engine does not fire</td>
<td>Ignition battery low</td>
<td>Charge or replace battery</td>
</tr>
<tr>
<td></td>
<td>Battery wires faulty or loose</td>
<td>Replace wires or Re-connect/check connections</td>
</tr>
<tr>
<td></td>
<td>Faulty spark plug or not firing</td>
<td>Replace spark plug or check for spark *</td>
</tr>
<tr>
<td></td>
<td>Engine flooded</td>
<td>Remove plug, rotate prop to remove fuel</td>
</tr>
<tr>
<td>Engine starts, then rpm increases till engine cuts out</td>
<td>Fuel not reaching engine</td>
<td>Check for: a) fuel in tank b) fuel tubing cut, blocked, or kinked c) carburetor clogged</td>
</tr>
</tbody>
</table>

*This can be done by removing the spark plugs from the cylinders of the engine and contacting the plugs on the outside of the crankcase. Have an assistant turn the engine over while checking this and be sure to have the spark plugs firmly plugged into the ignition wires. **Warning:** *The high voltage from the ignition can cause bodily harm, especially when checking for spark in this manner.*

### Optional Digital Tachometer (not included)

**An optional digital tachometer is available that can be directly connected to the ignition and display the RPMs of the engine. This unit can be installed on the aircraft or used to spot check the Engine RPMs. Do not install or uninstall the Digital Tachometer while the engine is running.**

Many of the DLE Ignition modules have an additional lead to plug into the optional tachometer. If your ignition module does not have this additional lead, the digital tachometer can still be used. Simply use the Y-harness (included with the Digital Tachometer) to connect to the pick-up lead from the engine. Be sure to secure all connections and to secure the Digital Tachometer or leads on the aircraft used.
Engine Maintenance

Please clean the fuel filter in the DLE Carburetor periodically. Failure to do so may result in miss-calibration of the needle adjustments. In order to do this it is necessary to remove the Phillips head screws which secure the carburetor filter cover and the carburetor filter gasket. Use only carburetor cleaner to spray around the opening of the filter.
Warranty Information

The DLE-170 has a two year limited warranty through Hobby Services beginning at date of purchase. Please retain your receipt as your proof of purchase.
