## Common Operations used in function setup screen

- Operations value setting     | 168  |
- Operations related to flight conditions | 168  |
- Operations related to fine tuning VR | 169  |
- Operations related to servo speed | 170  |
- Curve setting operation      | 171  |
- Switch selection method      | 174  |
- Updating                     | 177  |
INTRODUCTION

Thank you for purchasing a Futaba* FASSTest-2.4GHz™ T18SZ series digital proportional R/C system. This system is extremely versatile and may be used by beginners and pros alike. In order for you to make the best use of your system and to fly safely, please read this manual carefully. If you have any difficulties while using your system, please consult the manual, our online Frequently Asked Questions (on the web pages referenced below), your hobby dealer, or the Futaba Service Center.

*FASSTest: Futaba Advanced Spread Spectrum Technology extend system telemetry

Due to unforeseen changes in production procedures, the information contained in this manual is subject to change without notice.

Support and Service: It is recommended to have your Futaba equipment serviced annually during your hobby’s “off season” to ensure safe operation.

IN NORTH AMERICA

Please feel free to contact the Futaba Service Center for assistance in operation, use and programming. Please be sure to regularly visit the T18SZ Frequently Asked Questions web site at www.futaba-rc.com/faq/. This page includes extensive programming, use, set up and safety information on the T18SZ radio system and is updated regularly. Any technical updates and US manual corrections will be available on this web page. If you do not find the answers to your questions there, please see the end of our F.A.Q. area for information on contacting us via email for the most rapid and convenient response.

Don’t have Internet access? Internet access is available at no charge at most public libraries, schools, and other public resources. We find internet support to be a fabulous reference for many modelers as items can be printed and saved for future reference, and can be accessed at any hour of the day, night, weekend or holiday. If you do not wish to access the internet for information, however, don’t worry. Our support teams are available Monday through Friday 8-5 Central time to assist you.

FOR SERVICE ONLY:
Futaba Service Center
3002 N. Apollo Drive, Suite 1
Champaign, IL 61822
Phone: 217-398-0007
www.futaba-rc.com/service.html
Email: futabaservice@hobbico.com

FOR SUPPORT:
(PROGRAMMING AND USER QUESTIONS)
Please start here for answers to most questions:
www.futaba-rc.com/faq/
Fax: 217-398-7721
Phone: 217-398-8970 option 2

OUTSIDE NORTH AMERICA

Please contact your Futaba importer in your region of the world to assist you with any questions, problems or service needs.

Please recognize that all information in this manual, and all support availability, is based upon the systems sold in North America only. Products purchased elsewhere may vary. Always contact your region’s support center for assistance.
Application, Export, and Modification
1. This product may be used for model airplane or surface (boat, car, robot) use. It is not intended for use in any application other than the control of models for hobby and recreational purposes. The product is subject to regulations of the Ministry of Radio/Telecommunications and is restricted under Japanese law to such purposes.
2. Exportation precautions:
   (a) When this product is exported from the country of manufacture, its use is to be approved by the laws in the country of destination governing devices that emit radio frequencies. If this product is then re-exported to other countries, it may be subject to restrictions on such export. Prior approval of the appropriate government authorities may be required. If you have purchased this product from an exporter outside your country, and not the authorized Futaba distributor in your country, please contact the seller immediately to determine if such export regulations have been met.
   (b) Use of this product with other than models may be restricted by Export and Trade Control Regulations, and an application for export approval must be submitted. This equipment must not be utilized to operate equipment other than radio controlled models.
3. Modification, adjustment, and replacement of parts: Futaba is not responsible for unauthorized modification, adjustment, and replacement of parts on this product. Any such changes may void the warranty.

Compliance Information Statement (for U.S.A.)
This device, trade name Futaba Corporation, complies with part 15 of the FCC Rules. Operation is subject to the following two conditions:
(1) This device may not cause harmful interference, and
(2) This device must accept any interference received, including interference that may cause undesired operation.
(3) This module meets the requirements for a mobile device that may be used at separation distances of more than 20cm from human body.
To meet the RF exposure requirements of the FCC this device shall not be co-located with another transmitting device.
The responsible party of this device compliance is:
Futaba Service Center
3002 N Apollo Drive Suite 1, Champaign, IL 61822 U.S.A.
TEL (217)398-8970 or E-mail: support@hobbico.com (Support)
TEL (217)398-0007 or E-mail: futabaservice@hobbico.com (Service)

The RBRC. SEAL on the nickel-cadmium battery contained in Futaba products indicates that Futaba Corporation is voluntarily participating in an industry-wide program to collect and recycle these batteries at the end of their useful lives, when taken out of service within the United States. The RBRC. program provides a convenient alternative to placing used nickel-cadmium batteries into the trash or municipal waste system, which is illegal in some areas.
(for USA)
You may contact your local recycling center for information on where to return the spent battery. Please call 1-800-8BATTERY for information on Ni-Cd battery recycling in your area. Futaba Corporation involvement in this program is part of its commitment to protecting our environment and conserving natural resources.
*RBRC is a trademark of the Rechargeable Battery Recycling Corporation.
Federal Communications Commission Interference Statement (for U.S.A.)
This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation.

This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:
--Reorient or relocate the receiving antenna.
--Increase the separation between the equipment and receiver.
--Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
--Consult the dealer or an experienced radio/TV technician for help.

CAUTION:
To assure continued FCC compliance:
Any changes or modifications not expressly approved by the grantee of this device could void the user's authority to operate the equipment.

Exposure to Radio Frequency Radiation
To comply with FCC RF exposure compliance requirements, a separation distance of at least 20cm must be maintained between the antenna of this device and all persons. This device must not be co-located or operating in conjunction with any other antenna or transmitter.

FLYING SAFETY

Where to Fly
We recommend that you fly at a recognized model airplane flying field. You can find model clubs and fields by asking your nearest hobby dealer, or in the US by contacting the Academy of Model Aeronautics.

You can also contact the national Academy of Model Aeronautics (AMA), which has more than 2,500 chartered clubs across the country. Through any one of them, instructor training programs and insured newcomer training are available. Contact the AMA at the address or toll-free phone number below.

Academy of Model Aeronautics
5161 East Memorial Drive
Muncie, IN 47302
Tele. (800) 435-9262
Fax (765) 289-4248
or via the Internet at http://www.modelaircraft.org

Always pay particular attention to the flying field’s rules, as well as the presence and location of spectators, the wind direction, and any obstacles on the field. Be very careful flying in areas near power lines, tall buildings, or communication facilities as there may be radio interference in their vicinity.
Precautions

Application, Export, and Modification Precautions.

1. This product is only designed for use with radio control models. Use of the product described in this instruction manual is limited to radio control models.

2. Export precautions:
   a) When this product is exported, it cannot be used where prohibited by the laws governing radio waves of the destination country.
   b) Use of this product with other than models may be restricted by Export and Trade Control Regulations.

3. Modification, adjustment, and parts replacement:
   Futaba is not responsible for unauthorized modification, adjustment, or replacement of parts on this product.

For safe use

Please observe the following precautions to ensure safe use of this product at all times.

Meaning of Special Markings:

The parts of this manual indicated by the following marks require special attention from the standpoint of safety.

⚠️ DANGER - Procedures which may lead to dangerous conditions and cause death/serious injury if not carried out properly.

⚠️ WARNING - Procedures which may lead to a dangerous condition or cause death or serious injury to the user if not carried out properly, or procedures where the probability of superficial injury or physical damage is high.

⚠️ CAUTION - Procedures where the possibility of serious injury to the user is small, but there is a danger of injury, or physical damage, if not carried out properly.

⚠️ = Prohibited    ⚠️ = Mandatory

WARNING: Always keep electrical components away from small children.

Flying Precautions

⚠️ WARNING

⚠️ Never grasp the transmitter antenna while flying.
   - The transmitter output may drop drastically.

⚠️ Always make sure that all transmitter stick movements operate all servos properly in the model prior to flight. Also, make sure that all switches, etc. function properly as well. If there are any difficulties, do not use the system until all inputs are functioning properly.

⚠️ Never fly in the range check mode.
   - In the dedicated range test range check mode, the transmitter output range is reduced and may cause a crash.

⚠️ While operating, never touch the transmitter with, or bring the transmitter near, another transmitter, a cellphone, or other wireless devices.
   - Doing so may cause erroneous operation.

⚠️ Do not point the antenna directly toward the aircraft during flight.

⚠️ The antenna is directional and the transmitter output is weakest. (The strength of the radio waves is greatest from the sides of the antenna.)

⚠️ Never fly on a rainy day, when the wind is strong, and at night.
   - Water could lead to failure or improper functionality and poor control of the aircraft which could lead to a crash.

⚠️ Never turn the power switch on and off during flight or while the engine or motor is running.
   - Operation will become impossible and the aircraft will crash. Even if the power switch is turned on, operation will not begin until transmitter and receiver internal processing is complete.

⚠️ Do not start the engine or motor while wearing the neck strap.
   - The neck strap may become entangled with the rotating propeller, rotor, etc. and cause a serious injury.

⚠️ Do not fly when you are physically impaired as it could pose a safety hazard to yourself or others.
Do not fly at the following places:
- Near another radio control flying field.
- Near or above people.
- Near homes, schools, hospitals or other places where people congregate.
- Near high voltage lines, high structures, or communication facilities.

When setting the transmitter on the ground during flight preparations, do not stand it upright.
- The transmitter may tip over, the sticks may move and the propeller or rotor may rotate unexpectedly and cause injury.

Do not touch the engine, motor, or FET amp during and immediately after use.
- These items may become hot during use.

For safety, fly so that the aircraft is visible at all times.
- Flying behind buildings or other large structures will not only cause you to lose sight of the aircraft, but also degrade the RF link performance and cause loss of control.

From the standpoint of safety, always set the fail safe function.
- In particular, normally set the throttle channel to idle. For a helicopter, set the throttle channel to maintain a hover.

When flying, always return the transmitter setup screen to the Home screen.
- Erroneous input during flight is extremely dangerous.

Always check the remaining capacity of the transmitter and receiver batteries before each flying session prior to flight.
- Low battery capacity will cause loss of control and a crash.

Always check operation of each control surface and perform a range test before each flying session. Also, when using the trainer function, check the operation of both the teacher and student transmitter.
- Even one transmitter setting or aircraft abnormality can cause a crash.

Before turning on the transmitter:
1. Always move the transmitter throttle stick position to the minimum (idle) position.
2. Turn on the transmitter first and then the receiver.

When turning off the transmitter’s power switch after the engine or motor has stopped (state in which it will not rotate again):
1. Turn off the receiver power switch.
2. Then turn off the transmitter power switch.
- If the power switch is turned on/off in the opposite order, the propeller may rotate unexpectedly and cause a serious injury.
- Also always observe the above order when setting the fail safe function.
- Maximum low throttle: Direction in which the engine or motor runs at the slowest speed or stops.

When adjusting the transmitter, stop the engine except when necessary. In the case of a motor, disconnect the wiring that allows it to continue operation. When doing so, please exercise extreme caution. Ensure that the aircraft is secured and that it will not come into contact with anything or anyone. Ensure that the motor will not rotate prior to making any adjustments. Unexpected high speed rotation of the engine may cause a serious injury.

### Battery and Charger Handling Precautions

**DANGER**

- Do not recharge a battery that is damaged, deteriorated, leaking electrolyte, or wet.
- Do not use the charger in applications other than as intended.
- Do not allow the charger or battery to become wet.
- Do not use the charger when it or your hands are wet. Do not use the charger in humid places.
- Do not short circuit the battery.
- Do not solder or repair, deform, modify, or disassemble the battery and/or battery charger.
- Do not drop the battery into a fire or bring it near a fire.

- Do not charge and store the battery in direct sunlight or other hot places.
- Do not charge the battery if it is covered with any object as it may become very hot.
- Do not use the battery in a combustible environment.
- The gas could ignite and cause an explosion or fire.

- Always charge the battery before each flying session.
- If the battery goes dead during flight, the aircraft will crash.

- Charge the battery with the dedicated charger supplied with the set.
■ Charging the battery past the specified value may cause a fire, combustion, rupture, or liquid leakage. When quick charging, do not charge the battery above 1°C.
■ Do not charge the battery while riding in a vehicle. Vibration will prevent normal charging.

⚠️ When using the Li-Fe battery, do not connect the charger to the balance charge connector and the power connector at the same time.
■ Doing so could cause a fire, combustion, generation of heat, rupture, or liquid leakage.

⚠️ WARNING

⚠️ Do not touch the charger and battery for any length of time during charging.
■ Doing so may result in burns.

⚠️ Do not use a charger or battery that has been damaged.

⚠️ Do not touch any of the internal components of the charger.
■ Doing so may cause electric shock or a burn.

⚠️ If any abnormalities such as smoke or discoloration are noted with either the charger or the battery, remove the battery from the transmitter or charger and disconnect the power cord plug and do not use the charger.
■ Continued use may cause fire, combustion, generation of heat, or rupture.

⚠️ Do not subject the batteries to impact.
■ Doing so may cause fire, combustion, generation of heat, rupture, or liquid leakage.

⚠️ Use and store the battery and battery charger in a secure location away from children.
■ Not doing so may cause electric shock or injury.

⚠️ If the battery leaks liquid or generates an abnormal odor, immediately move it to a safe place for disposal.
■ Not doing so may cause combustion.

⚠️ If the battery liquid gets on your skin or clothing, immediately flush the area with tap water or other clean water.
■ Consult a doctor. The liquid can cause skin damage.

⚠️ After the specified charging time has elapsed, end charging and disconnect the charger from the receptacle.

⚠️ When recycling or disposing of the battery, isolate the terminals by covering them with tape.
■ Short circuit of the terminals may cause combustion, generation of heat or rupture.

⚠️ CAUTION

⚠️ Do not use the battery with devices other than the corresponding transmitter.

⚠️ Do not place heavy objects on top of the battery or charger. Also, do not place the battery or charger in any location where it could fall.
■ Doing so may cause damage or injury.

⚠️ Do not store or use the battery and charger where it is dusty or humid.
■ Insert the power cord plug into the receptacle only after eliminating the dust.

⚠️ After the transmitter has been used for a long time, the battery may become hot. Immediately remove it from the transmitter.

⚠️ Not doing so may cause a burn.

⚠️ Do not charge the battery in extreme temperatures.
■ Doing so will degrade the battery performance. An ambient temperature of 10°C to 30°C (50°F to 86°F) is ideal for charging.

⚠️ Unplug the charger when not in use.

⚠️ Do not bend or pull the cord unreasonably and do not place heavy objects on the cord.
■ The power cord may be damaged and cause combustion, generation of heat, or electric shock.
**SD Card (Commercial Product) Handling Precautions**

*Read the instruction manual supplied with the SD card for details.

⚠️ **WARNING**

🚫 Never disassemble or modify the SD card.
🚫 Do not unreasonably bend, drop, scratch or place heavy objects on the SD card.
🚫 If smoke or an abnormal odor emanates from the card, immediately turn off the transmitter power.

⚠️ **CAUTION**

⚠️ Since the SD card is an electronic device, be careful of static electricity.
- Static electricity may cause erroneous operation or trouble.
⚠️ Do not use the SD card near radio and television sets, audio equipment, motors and other equipment that generate noise.
- Doing so may cause erroneous operation.
⚠️ Do not store the SD card in the following places:
- Where the humidity is high
- Where the temperature difference is severe
- Where it is very dusty
- Where the card will be exposed to shock and vibration
- Near speakers and other magnetic devices

⚠️ **CAUTION**

🚫 Do not use the SD card where it may be exposed to water, chemicals, oil, or other fluids.
- Doing so may cause a fire or electric shock by short circuiting.
🚫 Do not insert foreign matter into the transmitter card slot.
- Doing so may cause erroneous operation.
🚫 Do not expose the card to shock and vibration and do not remove the card from the card slot while data is being written or read.
- The data may be damaged or lost.

〇 **Recorded data**

The data recorded on the SD card cannot be compensated regardless of the contents or cause of the trouble or obstruction. Futaba does not perform data restoration or recovery work.

**Storage and Disposal Precautions**

⚠️ **WARNING**

🚫 Keep wireless equipment, batteries, aircraft, etc. away from children.

⚠️ **CAUTION**

⚠️ Do not store wireless devices in the following places:
- Where it is extremely hot (40°C [104°F] or higher) or cold (-10°C [14°F] or lower)
- Where the equipment will be exposed to direct sunlight
- Where the humidity is high
- Where vibration is prevalent
- Where it is very dusty
- Where the device may be exposed to steam and heat

⚠️ **CAUTION**

⚠️ When the device will not be used for a long time, remove the battery from the transmitter and aircraft and store them in a dry place where the temperature is between 0 and 30°C [32F and 86F].
- Leaving batteries inside your model and radio when they are not being used for long periods will result in battery deterioration, liquid leakage and other damage.

**Other Precautions**

⚠️ **CAUTION**

⚠️ Do not directly expose plastic parts to fuel, oil, exhaust gas, etc.
- If left in such an environment, the plastic may be attacked and damaged.
- Since the metal parts of the case may corrode, always keep them clean.
⚠️ Join the Academy of Model Aeronautics.

⚠️ The Academy of Model Aeronautics (AMA) provides guidelines and liability protection should the need arise.
⚠️ Always use genuine Futaba products such as transmitter, receiver, servo, FET amplifier, battery, etc.
- Futaba is not responsible for damage sustained by combination with other than Futaba Genuine Parts. Use the parts specified in the instruction manual and catalog.
Features

FASSTest system

The T18SZ transmitter has adopted the bidirectional communication system "FASSTest". Data from the receiver can be checked in your transmitter. FASSTest is a maximum 18 channels (linear 16 channels + switch 2 channels) 2.4GHz dedicated system.

Color touch screen LCD

T18SZ has a HVGA 4.3inch full color Backlight LCD touch screen. The screen is manufactured of a transflective construction which enables both indoor and outdoor visibility.

S.BUS2 system

By using the S.BUS2 system multiple servos, gyros and telemetry sensors are easily installed with a minimum amount of cables.

Model types

Multicopter: 8 swash types are available for helicopters. 7 types of main wings and 3 types of tail wings are available for airplanes and gliders. Functions and mixing functions necessary for each model type are set in advance at the factory.

LiFe battery

T18SZ is operated by a 6.6 V/2,100 mAh Lithium Ferrite battery.

SD card (Secure Digital memory card) (Not included)

Model data can be saved to an SD card (SD:32MB-2GB SDHC:4GB-32GB). When T18SZ transmitter software files are released, the software can be updated by using an SD card update.

Edit button

Two edit buttons are provided, and the operating screen can be immediately "Returned" to the HOME screen during operation. Setting operation can be performed easily by combining this button with a touch sensor.

Vibration function

Selects a function that alerts the operator to various alarms by vibrating the transmitter in addition to sounding a buzzer.

Speech function

A function is equipped which allows the system to provide telemetry data audibly. This function can also be utilized with commercially available earphones.
Contents and Technical Specifications

Your T18SZ includes the following components:
- T18SZ transmitter
- R7008SB Receiver
- FT2F2100BV2 LiFe battery & charger
- Switch harness
- Mini driver
*The set contents depend on the type of set.

Transmitter T18SZ
(2-stick, 18-channel, FASSTest-2.4G system)
Transmitting frequency: 2.4GHz band
System: FASSTest18CH, FASSTest12CH, FASST MULT, FASST 7CH, T-FHSS, S-FHSS, switchable
Power supply: 6.6V FT2F2100BV2 LiFe battery

Receiver R7008SB
(FASST-2.4G system, dual antenna diversity, S.BUS/S.BUS2 system)
Power requirement: 3.7V~7.4V battery or regulated output from ESC, etc. (*1)
Size: 0.98 x 1.86 x 0.56 in. (24.9 x 47.3 x 14.3 mm)
Weight: 0.38 oz. (10.9g)
(*1) When using ESCs make sure that the regulated output capacity meets your usage application.

Note: The battery in the T18SZ transmitter does not arrive already attached to the battery connector. Please connect the battery connector before use.

Multicopter/Robot specifications

Throttle stick warning

![Ratchet type (General transmitter)](image)

The throttle stick doesn't return neutrally.

![Self neutral type (Multicopter/Robot specification)](image)

The throttle stick returns neutrally by a spring.

⚠️ WARNING
You cannot use the self-neutral throttle stick for R/C airplanes, helicopters, and certain multicopters. Allowing the engine/motor to reach middle speed via automatic throttle stick return is very dangerous. If using the T18SZ for R/C airplanes and helicopters, you must change the throttle stick to the ratchet type.
Accessories

The following additional accessories are available from your dealer. Refer to a Futaba catalog for more information:

- FT2F2100BV2 transmitter battery pack - the (2,100mAh) transmitter LiFe battery pack may be easily exchanged with a fresh one to provide enough capacity for extended flying sessions.

- Trainer cord - the optional training cord may be used to help a beginning pilot learn to fly easily by placing the instructor on a separate transmitter. Note that the T18SZ transmitter may be connected to another T18SZ system, as well as to any other models of Futaba transmitters. The T18SZ transmitter uses one of the three cord plug types according to the transmitter connected. (Refer to the description at the TRAINER function instructions). The part number of this cord is: FUTM4405.

- Servos - there are various kinds of servos. Please choose the Futaba servos that best suit your model and purpose. If you utilize an S.BUS system, you should choose a S.BUS servo. An analog servo cannot be used if "FASSTest12CH mode" is used.

- Telemetry sensor - please purchase an optional sensor, in order to utilize bidirectional communication system and to acquire the information from a model high up in the sky. [Temperature sensor : SBS-01T/TE] [Altitude sensor : SBS-01A] [RPM sensor magnet type : SBS-01RM] [RPM sensor optical type : SBS-01RO] [RPM sensor brushless motor type : SBS-01RB] [GPS sensor : SBS-01G] [Voltage sensor : SBS-01V] [S.BUS servo sensor : SBS-01S]

- Neckstrap - a neckstrap may be connected to your T18SZ system to make it easier to handle and improve your flying precision since your hands won’t need to support the transmitter’s weight.

- Y-harnesses, servo extensions, hub, etc - Genuine Futaba extensions and Y-harnesses, including a heavy-duty version with heavier wire, are available to aid in your larger model and other installations.

- Gyros - a variety of genuine Futaba gyros is available for your aircraft or helicopter needs.

- Governor - for helicopter use. Automatically adjusts throttle servo position to maintain a constant head speed regardless of blade pitch, load, weather, etc.

- Receivers - various models of Futaba receivers may be purchased for use in other models. (Receivers for FASSTest and FASST, T-FHSS, S-FHSS types are available.)

- SBD-2, S.BUS decoder -The SBD-2 is a converter for using conventional servos (other than an S.BUS servo) with the S.BUS/S.BUS2 system. The SBD-2 connects to the receiver output of a S.BUS/S.BUS2 system and eight servos can be used. SBD-2 can change the output CH by selecting from 9 groups using a rotary switch. SBD-2 can use EXT battery (for servos).
Transmitter controls

T18SZ

- Monitor LED
- Antenna
- Dial LD.RD
- Carrying handle
- Switch SA.SB.SE.SF
- Switch SC.SD.SG.SH
- Slide lever LS
- Slide lever RS
- Stick J3
- Stick J4
- Stick J1
- Stick J2
- Digital trim T1 ~ T6
- HOME/EXIT Button
- Battery cover
- Color LCD display Touch Panel
- Power Switch
- Hook
- U.MENU/MON. Button (User menu/Servo monitor)

The panel displays shown in this manual may vary from your own, depending upon your model type. Panel displays may also vary as a result of version upgrades or other changes.
**Transmitter's antenna**

As with all radio frequency transmissions, the strongest area of signal transmission is from the sides of the transmitter's antenna. As such, the antenna should not be pointed directly at the model. If your flying style creates this situation, easily move the antenna to correct this situation.

![Antenna Diagram](image)

**Rotating antenna**

The antenna can be rotated 180 degrees and angled 90 degrees. Forcing the antenna further than this can damage it. The antenna is not removable.

![Antenna Rotation Diagram](image)

**CAUTION**

- **Do not grasp the transmitter's antenna during flight.**
  - Doing so may degrade the quality of the RF transmission to the model.

- **Do not carry the transmitter by the antenna.**
  - The antenna wire may break, making operation impossible.

- **Do not pull the antenna forcefully.**
  - The antenna wire may break, making operation impossible.
Switch (SA-SH)

- **SF**: 2 positions; Alternate; Long lever
- **SE**: 3 positions; Alternate; Short lever
- **SH**: 2 positions; Momentary; Long lever
- **SG**: 3 positions; Alternate; Short lever
- **SA**: 3 positions; Alternate; Short lever
- **SB**: 3 positions; Alternate; Long lever
- **SC**: 3 positions; Alternate; Long lever
- **SD**: 3 positions; Alternate; Short lever

*Self return

2 positions 3 positions Alternate Momentary
Volume

The volume LD and RD knobs allow analog input.

*The T18SZ transmitter beeps when the volume knob reaches the center position.
*You can use each setting screen of the mixing functions to select volumes and define the direction of movement.

Slide Lever

LS (right), RS (Left):
The Linear Slider LS and RS offer analog input.

*The T18SZ transmitter beeps when the lever comes to the center.
*You can select a slide lever and set the movement direction on the setting screen of mixing functions.
Digital Trims T1-T6

This transmitter is equipped with 6 digital trims. Each time you press a trim button, the trim position moves one step. If you continue pressing it, the trim position starts to move faster. In addition, when the trim position returns to the center, the tone will change. You can always monitor trim positions by referencing the LCD screen.

*You can select the trim step amount and the display unit on the home screen on the T1-T6 setting screen within the linkage menu.

Note: The trim positions you have set will be stored in the non-volatile memory and will remain there.

The upper digital trimmers T5 and T6 offer analog input.

*You can select a slide lever and set the movement direction on the setting screen of mixing functions.

Digital trim operational example

*Example Stick Mode2

◆When the airplane goes up while the elevator stick is neutral.

◆Elevator trim to down

◆Adjust so that the airplane flies level.

◆When the airplane dives while the elevator stick is neutral.

◆Elevator trim to up

Up
Transmitter LiFe Battery FT2F2100B V2

Installing/removing the FT2F2100B V2

1. A side battery cover is opened.

2. Stick the sponge tape to the side of the battery.

3. Install the battery into the transmitter.

4. Connect the battery connector.

5. Close the battery cover completely.

- This 2P connector connects to the transmitter.
- FT2F2100B V2 LiFe Battery

The balance charge connector is not connected when the battery is installed in the transmitter.

*This connector is used when charging with the LBC-4ES, which is sold separately.
Charging an LiFe battery

1. Plug the transmitter cord of the special charger into the charging jack on the side of the transmitter.
2. Plug the charger into an AC outlet.
3. Check that the charging LED lights.

4. Disconnect the charge plug.
5. Disconnect the AC plug.

The charging time when charging the FT2F2100BV2 battery with the optional special charger is approximately 3 hours.

When the battery will not be used for a long time, to prevent it from deteriorating we recommend that it be kept in about the half capacity state instead of fully charged. Also be careful that the battery does not enter the over-discharged state due to self-discharge. When the transmitter will not be used for a long time, you should always remove its battery. Periodically (about every 3 months) charge the battery.

Battery removal

Note: If you remove the battery while the power is on, the data you have set will not be saved.

1. Open the battery cover.
2. Disconnect the battery connector.
3. Close the battery cover completely.

**WARNING**

Be careful not to drop the battery.

Never disconnect the battery connector from the T18SZ transmitter after turning off the power until the screen is completely blank and the transmitter has shut down completely.

* Internal devices such as memories may be damaged.
* If there is any problem, the message “Backup Error” will be shown the next time when you turn on the power of the transmitter. Do not use the transmitter as it is. Send it to the Futaba service center.

**WARNING**

Never plug the charger into an outlet other than the indicated voltage.

* Plugging the charger into the wrong outlet could result in an explosion or fire.

Do not plug and unplug the charger when your hands are wet.

* It may cause an electric shock.

Do not overcharge/overdischarge the battery.

* Overcharging/Overdischarging a battery can result in burns, fire, injuries, or loss of sight due to overheating, breakage, or electrolyte leakage.

**CAUTION**

When the charger is not in use, disconnect it from the AC outlet.

* Do this to prevent accidents and to avoid overheating.
How to turn transmitter power ON/OFF

When turning on the power, the T18SZ transmitter will begin emitting RF automatically after it confirms the surrounding RF conditions. The status of the transmitter is displayed by LED at the upper part of the front of a T18SZ.

*If THR stick is high, a WARNING screen will appear. Another warning will appear if a power supply is attached. (In Multicopter mode, the THR position alarm will not appear.)

**Power ON**

Throttle Stick Low

<table>
<thead>
<tr>
<th>Power Switch</th>
<th>Power Switch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Right or Left Long Push</td>
<td>Right and Left Push</td>

</thead>
<tbody>
<tr>
<td>Right or Left Long Push</td>
<td>Right or Left Long Push</td>
</tr>
</tbody>
</table>

**If the "Thr position" alarm displays**

*If the throttle stick is in the high position when the power is turned ON

When the alarm activates, lower the throttle stick before turning the receiver power ON.

*If the power is turned ON when the idle-up, air brake, etc., switches are ON, the above warning will display. Ensure the relevant switches are turned OFF.

**Turning on the power switches**

1. Turn on the transmitter power switch.
2. Turn on the receiver or speed control power switch.

**Turning off the power switches**

Always be sure the motor/engine is stopped.

1. Turn off the receiver or speed control power switch.
2. Then turn off the transmitter power switch.
Tap the panel with your finger to enter data.

*Plastic film is attached to the Touch Panel. Please be careful so that you don’t scratch the Touch Panel with anything hard such as a metal object. Don’t push the Touch Panel with excessive force or drop anything on the panel.

*Although you may find some air bubbles under the plastic panel due to environmental changes such as temperature, it is not a defect and will cause no problems.

*Color LED is made from many pixels. Some pixels hold lighting. Moreover, some pixels go out. And a screen may flicker. Such condition is the characteristics of color LED. It is not failure.

---

**HOME/EXIT and U.MENU/MON.**

Tapping the settings buttons for each value on the settings screen will cause value input buttons to appear at the top of the panel.

Pressing and holding a value will return it to its default setting.

Value input buttons display at the top of the panel.

Large change in value  Small change in value  Large change in value

<td>Panel lock / Lock release</td>
<td></td>
</tr>
</tbody>
</table>
**Panel lock**

Temporarily activating this function makes it impossible to change data by mistakenly touching keys during flight.

**How to lock**
1. The home screen is displayed.
2. Press the HOME/EXIT button for about 1 second. "Key mark" is displayed and the keys disabled.

**How to unlock**
1. Press the Home/Exit button for about 1 second, and the panel will then become unlocked.

**CAUTION**

⚠️ The T18SZ’s touch screen is very sensitive. To avoid accidentally activating it during a flight, it is suggested that it be locked. Due to the touch screen’s sensitivity, allowing it to be touched during flight by a neck strap hook, servo extension, or even your hand could be dangerous. Please use the Touch Panel lock for added safety during flight.

**RF off mode**

Model operation is not possible, but panel operation without RF signal transmission is allowed. (Reduces battery power consumption during set-up.)
Monitor LED display

The status of the transmitter is displayed by LED at the upper part of the front of a T18SZ.

- FASST test mode → Light Blue light
- FASST mode → Green light
- FHSS mode → Yellow-green light
- RF-OFF → Violet light
- Starting → Red light
- Trainer Student → Blue light
- Range check mode → Slow blinking
- Receiver link mode → Fast blinking

  - Throttle stick
    - SLOW (moved to the bottom)
Stick Adjustment

Adjustment of the stick lever length

You can adjust the length of stick levers as you like. It is recommended to adjust the length of the sticks in line with your hand size.

1. Hold the lever head "B" and turn the lever head "A" counter-clockwise. The lock will be released.
2. Turn the lever-head "A" clockwise as you hold the lever-head "B" after placing it as you like.

3. Using your hand remove the transmitter’s rear rubber grips.

The tension of the self-return type stick lever can be adjusted.

1. First, remove the battery cover on the bottom of the transmitter. Next, unplug the battery wire and remove the battery from the transmitter.
2. Next, using a hand, remove the transmitter’s side cover (rubber). When using Mode 2, you will need to remove the side cover to expose the tension screw.

4. Use a 1.5mm hexagonal wrench to adjust the spring strength as you prefer by turning the adjusting screw of the stick you want to adjust.

*It is difficult to remove rear grips from the central site of a transmitter. Therefore, remove from the outside of rear grips.

*Turning the screw clockwise increases the tension.

CAUTION: If you loosen the screw too much, it can interfere with the operation of the sticks internally.
5. At the end of adjustment, re-install the side cover and rear grips.

**Adjustment of the stick lever angle**

You can make fine adjustments to the angle of a stick lever either inwards or outwards from the center stick position.

Use the attached 1.5mm hexagonal wrench (inside stylus) to turn the screw clockwise to adjust the stick outwards, or counter-clockwise to tilt it inward.

Note: Be careful not to turn the screw too far counterclockwise as it could fall out.
Adjustment of Throttle Stick (Ratchet System)

You can choose either airplane ratchet system or helicopter-touch.

1. Open the dust protection cap on the back of the transmitter that is covering the hole for throttle stick adjustment.

2. Use the attached 1.5mm hexagonal wrench (inside stylus) to turn the adjustment screw and set it as you prefer. Turning the screw clockwise increases the tension.

For airplanes: Adjust the screw on the left.

For helicopters: Adjust the screw on the right.

In changing the setting from airplane to helicopter (or from airplane to helicopter):

1. Turn the screw counter-clockwise until the throttle stick moves freely, and turn the screw clockwise to adjust it to the tension you prefer.

*This transmitter has two ratchet plates, one for airplane and the other one for helicopter. If you tighten both screws, you won't be able to achieve the adjustment that you need because of the overlap of those two adjustments.

*If you want to change the setting from airplane to helicopter (or from helicopter to airplane), turn the ratchet screw clockwise until the throttle stick moves freely. Then turn the screw for the helicopter until you get the tension you like.

*In the Mode 1/3, arrangement of a screw is opposite.
**SD Card (secure digital memory card) (not included)**

The T18SZ transmitter model data can be stored by using any commonly found SD card. When T18SZ transmitter update software is released, the software is updated using an SD card. The T18SZ is capable of using SD cards with a memory size between 32MB and 2GB.

---

**SD card reader/writer**

Saving model data and update files (released from Futaba) into the SD card, you can use those files on your T18SZ transmitter. Equipment for reading and writing SD cards is available at most electronics stores.

---

**Stored data**

When you have a problem of saving or reading data after a long period of use, please get a new SD card.

*We are not responsible for, and offer no compensation for, memory card data that fails or is damaged for any reason. Be sure to keep a backup of all important data stored in your SD card.

---

**Inserting/removing the SD card**

1. The side battery cover is remove-able.

2. The SD card slot is shown here in the figure below.

3. When the SD card is pressed in once again, the card will be released from the card slot and can be removed.

---

⚠️ **CAUTION**

- Be sure to turn off the power to the transmitter before inserting or removing the SD card.
- As the SD card is a precision device, do not use excessive force when inserting.
When using the trainer function, connect the optional trainer cable between the transmitters for teacher and student.

*You can set the trainer function on the Trainer Function screen in the System menu.

**S.BUS connector (S.I/F)**
When using an S.BUS servo and telemetry sensor, connect them both here.

**Earphone plug**
Connecting a stereo headphone to this plug, the speech information of telemetry can be heard.

**Connector for battery charger**
This is the connector for charging the LiFe battery FT2F2100BV2 that is installed in the transmitter. Do not use any other chargers except the attached special charger corresponding to LiFe battery.

⚠️ **WARNING**

⚠️ Do not connect any other chargers except the special charger to this charging connector.

*If you take out the LiFe battery FT2F2100BV2 from the transmitter, you can use the optional balance charger LBC-4ES corresponding to LiFe battery.*

**Connector for trainer function**
When you use the trainer function, connect the optional trainer cable between the transmitters for teacher and student.

*You can set the trainer function on the Trainer Function screen in the System menu.*
Receiver nomenclature

Before using the receiver, be sure to read the precautions listed in the following pages.

Receiver R7008SB

Connector

"1 through 6": outputs for the channels 1 through 6
"7/B": outputs of 7 channels and power.
"8/SB": outputs of 8 channels or S.BUS port.

[S.BUS Servo  S.BUS Gyro]

*When using 8/SB as S.BUS, you have to set CH MODE of the following page to mode B or mode D.

"S.BUS2": outputs of S.BUS2 port.

[S.BUS2 Servo  S.BUS2 Gyro Telemetry Sensor]

*When using 9 or more channels, use an S.BUS function or use a second R7008SB and link both to your transmitter.

Connector insertion

Firmly insert the connector in the direction shown in the figure. Insert the S.BUS2 by turning it 90 degrees.

LED Monitor

This monitor is used to check the CH mode of the receiver.

Link/Mode Switch

Use the small plastic screw driver that was included with your receiver.

The Link/Mode Switch is also used for the CH mode selection.

Extra Voltage Connector

Use this connector when using a voltage telemetry device to send the battery voltage (DC0 ~ 70V) from the receiver to the transmitter.

You will need to purchase the optional External Voltage input cable (CA-RVIN-700) FUTM5551.

You can then make a cable with an extra connector to the External voltage connector.
**DANGER**

- Don't touch wiring.  
  - There is a danger of receiving an electric shock.
- Do not short-circuit the battery terminals.  
  - A short circuit across the battery terminals may cause abnormal heating, fire and burns.
- Please double check your polarity (+ and -) when hooking up your connectors.  
  - If + and - of wiring are mistaken, it will damage, ignite and explode.
- Don't connect to Extra Voltage before turning on a receiver power supply.

**R7008SB CH Mode**

The R7008SB receiver is a very versatile unit. It has 8 PWM outputs, S.BUS and S.BUS2 outputs. Additionally the PWM outputs can be changed from channels 1-8 to channels 9-16. If you only desire to use it as an 8 channel receiver (without S.BUS), it can be used without any setting changes.

The T18SZ has the ability to link to two R7008SB receivers. One of them outputting channels 1-8 and the other outputting channels 9-16 gives you 16 PWM channels. Instructions for this configuration and S.BUS operation follow.

[How to change the R7008SB Channel mode.]

1. Press and hold down the Link/Mode button on the R7008SB receiver.
2. Turn the receiver on while holding down the Link/Mode button. When the LED begins to blink green/red the button may be released.
3. The LED should now be blinking red in one of the patterns described by the chart below.
4. Each press of the Mode/Link button advances the receiver to the next mode.
5. When you reach the mode that you wish to operate in, press and hold the Mode/Link button for more than 2 seconds.
6. Once locked into the correct mode the LED will change to a solid color.
7. Please cycle the receiver(s) power off and back on again after changing the Channel Mode.

34  < Before Use >
**Receiver’s Antenna Installation**

The R7008SB has two antennas. In order to maximize signal reception and promote safe modeling, Futaba has adopted a diversity antenna system. This allows the receiver to obtain RF signals on both antennas and fly problem-free.

To obtain the best results of the diversity function, please refer to the following instructions:

1. The two antennas must be kept as straight as possible. Otherwise it will reduce the effective range.
2. The two antennas should be placed at 90 degrees to each other.
3. The antennas must be kept away from conductive materials, such as metal, carbon and fuel tank by at least a half inch. The coaxial part of the antennas does not need to follow these guidelines, but do not bend it in a tight radius.
4. Keep the antennas away from the motor, ESC, and other noise sources as much as possible.

*The two antennas should be placed at 90 degrees to each other.*

*The illustration demonstrates how the antenna should be placed.*

*Receiver Vibration and Waterproofing: The receiver contains precision electronic parts. Be sure to avoid vibration, shock, and temperature extremes. For protection, wrap the receiver in foam rubber or other vibration-absorbing materials. It is also a good idea to waterproof the receiver by placing it in a plastic bag and securing the open end of the bag with a rubber band before wrapping it with foam rubber. If you accidentally get moisture or fuel inside the receiver, you may experience intermittent operation or a crash. If in doubt, return the receiver to our service center for service.*
Mounting the Servo

Servo lead wires
To prevent the servo lead cable from being broken by vibration during flight, provide a little slack in the cable and fasten it at suitable points. Periodically check the cable during daily maintenance.

Mounting the power switch
When mounting a power switch to an airframe, make a rectangular hole that is a little larger than the total stroke of the switch so that you can turn the switch ON/OFF without binding.

Avoid mounting the switch where it can be covered by engine oil and dust. In general, it is recommended to mount the power switch on the side of the fuselage that is opposite the muffler.

Safety precautions when you install receiver and servos.

⚠️ WARNING

Connecting connectors

1️⃣ Be sure to insert the connector until it stops at the deepest point.

How to protect the receiver from vibration and water

1️⃣ Wrap the receiver with something soft such as foam rubber to avoid vibration. If there is a chance of getting wet, put the receiver in a waterproof bag or balloon.

Receiver's antenna

1️⃣ Never cut the receiver's antenna. Do not bind the receiver's antenna with the cables for servos.

1️⃣ Locate the receiver's antenna as far as possible from metals or carbon fiber components such as frames, cables, etc.

*Cutting or binding the receiver's antenna will reduce the radio reception sensitivity and range, and may cause a crash.

Servo throw

1️⃣ Adjust your system so that pushrods will not bind or sag when operating the servos to the full extent.

*If excessive force is continuously applied to a servo, the servo could be damaged due to force on the gear train and/or power consumption causing rapid battery drain.

Mounting servos

1️⃣ Use a vibration-proof rubber (such as rubber grommet) under a servo when mounting the servo on a servo mount. And be sure that the servo cases do not touch directly to the metal parts such as servo mount.

*If the servo case contacts the airframe directly, vibration will travel to and possibly damage the servo.
S.BUS/S.BUS2 Installation

This set uses the S.BUS/S.BUS2 system. The wiring is as simplified and clean mounting as possible, even with models that use a large number of servos. In addition, the wings can be quickly installed to the fuselage without any erroneous wiring by the use of only one simple wire, even when there are a large number of servos used.

- When using S.BUS/S.BUS2, special settings and mixes in your transmitter may be unnecessary.
- The S.BUS/S.BUS2 servos memorize the number of channels themselves. (settable with the T18SZ)
- The S.BUS/S.BUS2 system and conventional system (receiver conventional CH used) can be mixed.

S.BUS Glider usage example

S.BUS Aerobatic plane usage example
**S.BUS Wiring example**

*When using 8/SB as S.BUS, you must set the receiver to Mode B or Mode D. See R7008SB CH MODE TABLE.*

**S.BUS Servo**

Since the channel number is memorized by the S.BUS itself, any connector can be used. When the SBD-1, SBD-2 (sold separately) is used, ordinary servos can be used with the S.BUS system.

*SBD-1 cannot be used by S.BUS2 port.*

**WARNING**

**Power supply**

![Orange](image1.png)  **Hub (Another power supply)**

Used when using a separate power supply battery.

**Green**  **Hub**

Three connectors can be inserted.

**Optional Parts**

- **6-Terminal box (TB16PP)**
  Six connectors can be inserted

---

**S.BUS Gyro CGY750**

**Connection example**

*When using 8/SB as S.BUS, you must set the receiver to Mode B or Mode D. See R7008SB CH MODE TABLE.*

<td>×</td>
<td></td>
<td></td>
</tr>
<tr>
<td>S.BUS2</td>
<td>× (※)</td>
<td>○</td>
<td>○</td>
<td></td>
<td>○</td>
</tr>
</tbody>
</table>

(※) Don’t connect S.BUS Servo, S.BUS Gyro to S.BUS2 connector.

S.BUS servos and gyros and S.BUS2 servos and gyros must be used in the correct receiver ports. Please refer to the instruction manual to make sure you connect to the correct one.
**S.BUS/S.BUS2 device setting**

S.BUS/S.BUS2 servos or a telemetry sensor can be connected directly to the T18SZ. Channel setting and other data can be entered for the S.BUS/S.BUS2 servos or sensors.

1. Connect the S.BUS device you want to set with as shown in the figure.
2. Turn on the transmitter power.
3. Call the setup screen.
   - Servo: System Menu → S.BUS servo
   - Sensor: Linkage Menu → Sensor
4. Perform setting in accordance with each screen.
5. This sets the channel and other data for each S.BUS servo, or telemetry device to be used with the S.BUS device or receiver.

*It is not necessary to carry out multiple battery connections like a T18MZ/T14SG.

*When connecting many current-consuming servos, please use an additional power supply hub.

And electric power is supplied to a servo with another power supply.

**WARNING**

Do not disconnect or turn transmitter power OFF while S.BUS servo and telemetry sensor data is being saved.
- S.BUS servo and sensor save data will be lost, resulting in malfunction.

Do not use the S.I/F (S.BUS servo setup) connector with anything other than high-voltage-capable S.BUS servos.
- Transmitter battery voltage (6.6V) is conveyed directly.
- Using anything other than high-voltage-capable servos presents the danger that they will break.

**When separate power supply used**

When a large number of servos are used or when high current servos are used, the servos can be driven using a separate Power Supply 3-way hub.

- **Green**
  - Used when using a separate power supply battery.
Switch harness

This switch ESW-1J connects a Futaba receiver to a battery and is turned on and off in an FET circuit. Compared to using a mechanical switch, it allows more current to be sent with less loss.

Precautions

**WARNING**

- When the model is not being used, always remove or disconnect the battery.
  - When the switch is off, a slight amount of current still flows. Unless the switch and battery are disconnected, the battery will be damaged from excessive discharge.

- Always make sure that the switch harness is firmly attached to the fuselage of the model.
  - There is the danger of loss of control and crashing if the connector is disconnected by vibration and shock.

- Do not charge the receiver battery through the switch harness. Disconnect the receiver battery and charge to the manufacturer’s instructions.
  - There is no charge connector in this switch.

- Never reverse the battery polarity.
  - Reverse connection will immediately destroy the receiver, servo, etc.

- Ensure that the unit is mounted in an area that will eliminate exposure to fuel, water and vibration.
  - As with any electronic components, proper precautions are urged to prolong the life and increase the performance of the ESW-1J.

- Allow a slight amount of slack in the cables and fasten them at a suitable location to prevent any damage from vibration during flight.

- Never solder the ESW-1J or attempt to repair, deform, modify or disassemble them.

- Do not use the ESW-1J with anything other than an R/C model.

Futaba Corp. will not be responsible for damage caused by combination with other than genuine Futaba parts.
# BASIC OPERATION

## Home screen

This is the Home screen and descriptions of its menus. Use your finger to operate the touch screen.

<table>
<thead>
<tr>
<th>Battery voltage for receivers</th>
<th>Condition name</th>
<th>Battery Indicator</th>
</tr>
</thead>
<tbody>
<tr>
<td>• In FASSTest/T-FHSS mode, it is displayed. Receiver voltage and Ext voltage display</td>
<td>• The condition name that is currently used is displayed here.</td>
<td>• When the battery voltage reaches 5.8V, the alarm will beep. Land your aircraft immediately.</td>
</tr>
</tbody>
</table>

### Digital trim (T1 to T6)

- Trim position is displayed here.

### System timer

- This shows the accumulated time since the latest reset. (Each model / Total)
  (Hour):(Minute):(Second)

### Model Name

- The model name that is currently used is displayed here.

### User’s name

- The condition name that is currently used is displayed here.

### RF Indicator

- This is the Home screen and descriptions of its menus. Use your finger to operate the touch screen.

### Timer1, Timer2

- Timer is displayed here.
  Tap the time button to start/stop the timer. (When the screen is tapped for 1 second, timer is reset to the initial value.)

### System mode

- System (FASSTest18CH etc.) mode is displayed here.

### Date and Time

- The reception of the signal from the receiver to the transmitter is shown.
  • This does not affect flight.

### Model

- Tap the button to call Model Menu screen.

### System

- Tap the button to call each Menu screen.

### Linkage

- Tap the button to call Model Menu screen.

### Model select

- Tap the button to call each Menu screen.

### WARNING

⚠ **Be sure to confirm the model name before flying your aircraft.**

⚠ **Check the battery voltage as often as possible and try to charge the battery earlier. If the battery alarm makes a sound, land your aircraft immediately.**

*You can adjust the LCD contrast by the display setting in the system menu.*
Link procedure (T18SZ/R7008SB)

Each transmitter has an individually assigned, unique ID code. In order to start operation, the receiver must be linked with the ID code of the transmitter to which it is being paired. Once the link is made, the ID code is stored in the receiver and no further linking is necessary unless the receiver is to be used with another transmitter. When you purchase additional R7008SB receivers, this procedure is necessary; otherwise the receiver will not work.

**Link procedure**

1. Place the transmitter and the receiver close to each other within half (0.5m) meter.

   ![Transmitter and Receiver Close](image)

2. Turn on the transmitter.

3. Select [System type] at the Linkage menu and access the setup screen shown below by tapping the screen.

   ![Setup Screen](image)

4. When you use two receivers on one model, you must change from [Single] to [Dual].
   
   *Only two receivers can be used. In "Dual", two setting items come out. Input, respectively.

   ![ID Displays](image)

5. Battery fail-safe voltage can be changed from the initial value of 3.8V here.
   
   * Only in FASSTest/T-FHSS Mode.

6. [Link] is tapped. The transmitter will emit a chime as it starts the linking process.

   ![Link Chime](image)

7. When the transmitter starts to chime, power on the receiver. The receiver should link to the transmitter within about 1 second.

   ![Receiver Link](image)

8. If linking fails, an error message is displayed. Bring the transmitter closer to the receiver and repeat the procedure above from Step 2.
9. ACT will be chosen if telemetry is used. It is INH when not using it.

<table>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

10. When a telemetry function is enabled, the receiving interval (down-link interval) of sensor data can be changed. If a D/L interval is increased, the response of the sensor data display becomes slower, but stick response will improve.

Initial value: 1.0s
Adjustment range: 0.1s~2.0s

*If there are many FASSTest (T-FHSS) systems turned on around your receiver, it might not link to your transmitter. In this case, even if the receiver’s LED stays solid green, unfortunately the receiver might have established a link to one of other transmitters. This is very dangerous if you do not notice this situation. In order to avoid the problem, we strongly recommend you to double check whether your receiver is really under control by your transmitter by giving the stick input and then checking the servo response.

*Do not perform the linking operation when the drive motor is connected or the engine is running.

*When you use two receivers, please be sure to setup a "Rx1" and "Rx2" in the "dual" mode.

*Telemetry function cannot be used for the 2nd receiver. → FASSTest18CH

*Telemetry function cannot be used for the dual mode. → T-FHSS

*You must link one receiver at a time. If both power supplies to the receivers are switched on simultaneously, data is received incorrectly by the transmitter.

*You cannot link three receivers.

*Link is required when a system type is changed.

*Linking is required whenever a new model is made.

⚠️ WARNING

⚠️ After the linking is done, please cycle receiver power and check that the receiver to be linked is really under the control of the transmitter.

⚠️ Do not perform the linking procedure with motor's main wire connected or with the engine operating as it may result in serious injury.
If the receiver’s voltage does not display on the transmitter

- When the receiver has the transmitter’s ID in memory, a link is established and normal operation is allowed.
- When the transmitter has the receiver’s ID in memory, a link is established and telemetry functions are usable.

The transmitter stores receiver IDs by model; thus, if it does not have a particular receiver model ID stored in memory or has a different receiver ID stored, telemetry functions will be unusable. However, the device is operable as long as the receiver has the transmitter’s ID stored in memory.

---

**Link of model 1**

<table>
<thead>
<tr>
<th>Receiver ID: xxxxx1</th>
<th>Model 1: Rx ID: xxxxx1</th>

**Model 1 → Model 2**

| Device is operable if receiver has transmitter’s ID stored in memory |
| Model 1: Receiver ID: xxxxx1 |
| Model 2: Rx ID: xxxxx1 |
| Model 3: Rx ID: xxxxx1 |

---

**Telemetry usable**

| Receiver ID: xxxxx1 stored for Model 1 |
| Model 1: Rx ID: xxxxx1 |
| Model 2: Rx ID: xxxxx1 |
| Model 3: Rx ID: xxxxx1 |

---

**Telemetry usable**

| Model 1: Receiver ID: xxxxx1 |
| Model 2: Rx ID: xxxxx1 |
| Model 3: Rx ID: xxxxx1 |

---

When setting up a new model, before using it, first establish a link with the receiver that will be used with it.
Range Testing Your R/C System

It is extremely important to range check your models prior to each flying session. This enables you to ensure that everything is functioning as it should and to obtain maximum enjoyment from your time flying. The T18SZ transmitter incorporates a system that reduces its power output and allows you to perform such a range check.

**Range check mode**

1. While pushing previously "U.MENU/MON." button.

   ![THR Stick Slow.](image)

2. THR Stick Slow.

3. T18SZ Power ON.

4. Select "Range check" at the System menu.

   ![System menu](image)

   **Transmitter outputs a weaker signal. Perform a range check?**

5. "Start" tap.

   ![Range check mode on](image)

6. An HOME/EXIT button is pressed to end a range check.

**WARNING**

⚠️ Do not fly in the range check mode.

*Since the range of the radio waves is short, if the model is too far from the transmitter, control will be lost and the model will crash.

During this mode, the RF power output is reduced so the range test can be performed. In addition, when this mode is activated the right LED on the front of the transmitter starts blinking and the transmitter gives users a warning with a beeping sound.

The "Range check mode" continues for 60 seconds and after that the power will return to the normal level. To exit the "Range check mode" before the 60 seconds, press the "HOME/EXIT" button. NEVER start flying when the "Range check mode" is active.

Should you require additional time to perform a range check, highlight Restart before your time expires and tap the screen one time.

**Range check procedure**

1. With the "Range check mode" on, walk away from the model while simultaneously operating the controls. Have an assistant stand by the model to confirm that all controls are completely and correctly operational. You should be able to walk approximately 30-50 paces from the model without losing control.

2. If everything operates correctly, return to the model. Set the transmitter in a safe, yet accessible, location so it will be within reach after starting the engine or motor. Be certain the throttle stick is in the low throttle position, then start the engine or motor. Perform another range check with your assistant holding the aircraft with the engine running at various speeds. If the servos jitter or move inadvertently, there may be a problem. We would strongly suggest you do not fly until the source of the difficulty has been determined. Look for loose servo connections or binding pushrods. Also, be certain that the battery has been fully charged.
**Airplane basic setting procedure**

1. **Model addition and call**

   Initial setting assigns 1 model to the T18SZ transmitter. The Model Select function is used to add models and to select models which are already set.

   The data for up to 30 models can be saved to the transmitter. Data can also be saved to the optional SD card.

   The currently selected model name is displayed at the top of the screen. Before flying and before changing any settings, always confirm the model name.

2. **Model type selection**

   Select the model type matched to the aircraft with the Model type select function of the Linkage menu. For an airplane, select the model type from among the 2 types: airplane and glider. After the wing type is selected the tail type select screen is displayed. Select the tail type matched to the aircraft.

   There are 13 wing types and 3 tail types for airplane and glider.

3. **Fuselage linkage**

   Connect the ailerons, elevators, throttle, rudder, etc. in accordance with the model’s instruction manual. For a description of the connection method, see the "Servos connection by model type".

   Note: The channel assignment of the T18SZ is different from that of our existing systems. Note that even for the same "airplane model", when the wing type and tail type are different, the channel assignment may be different. (The channel assigned to each function can be checked at the "Function" of the Linkage menu.)

4. **Throttle cut setting**

   Throttle cut can be performed with one touch by a switch without changing the throttle trim position.

   Set throttle cut with the Throttle cut function of the Linkage menu. After activating the throttle cut function and selecting the switch, adjust the throttle position so that the carburetor becomes fully closed. For safety, the throttle cut function operates the throttle stick in the 1/3 or less (slow side) position.
5. Idle down setting

The idling speed can be lowered with one touch by a switch without changing the throttle trim position. Perform this setting with the Idle down function of the Linkage menu. After activating the Idle down function and selecting the switch, adjust the idle down speed. For safety, the idle down function acts only when the throttle stick is slow side.

*While the Throttle cut function is in operation, the Idle down function does not work.

6. AFR (D/R)

AFR function is used to adjust the throw and operation curve of the stick, lever, and switch functions for each flight condition. This is normally used after End point has defined the maximum throw directions.

7. Airbrake

This function is used when an air brake is necessary when taking off or diving, etc.

The preset elevators and flaps (camber flap, brake flap) offset amount can be activated by a switch.

The offset amount of the aileron, elevator, and flap servos can be adjusted as needed. Also the speed of the aileron, elevator, and flap servos can be adjusted. (Inside/Out side) A delay can be set for each condition, and a cut switch which will turn OFF the delay can be chosen. Trim amounts can be fine-tuned by setting a VR.

You can also set the auto mode, which will link Airbrake to a stick, switch, or dial. A separate stick switch or dial can also be set as the ON/OFF switch.

8. Addition of flight conditions

The Condition select function automatically allocates the Condition 1 for each model. Condition 1 is the default condition and is the only one active when a new model type is defined.

If you want to add flight conditions, please refer to a description of the Condition select function.

*The Condition 1 is always on, and remains on until other conditions are activated by switches.

*When a new condition is added, the model data of the Condition 1 is automatically copied to the new condition.

*You can set the model data of new condition in the switch ON state. However, if the group mode (Gr) was selected in advance, the same data will be input at all the conditions. Select the single mode (Sngl) and adjust only the condition you want to change. For Group/Single mode switching, refer to the description at the back of this manual.

*The Condition delay can be programmed for each channel. The Condition delay is used to change the servo throw smoothly when switching conditions.
**Helicopter basic setting procedure**

This section outlines examples of use of the helicopter functions of the T18SZ. Adjust the actual values, etc. to match the fuselage used.

1. **Model addition and call**

   Default setting assigns 1 model to the T18SZ. To add new models or to call a model already set, use the Model select function.

   ![](image1.png)

   This is convenient when calling a model after registering the model names in advance. (The data of up to 30 models can be saved at the transmitter. Data can also be saved to the optional SD card.)

   The currently called model is displayed at the top of the screen. Before flying and before changing any settings, always confirm the model name.

2. **Model type and swash type selection**

   If a different model type is already selected, select helicopter with the Model type function of the Linkage menu, and then select the swash type matched to the helicopter.

   ![](image2.png)

   *The Model type function automatically selects the appropriate output channels, control functions, and mixing functions for the chosen model type. Eight swash types are available for helicopters.*

   *For a description of the swash type selection, refer to the Model type function.*

3. **Flight condition addition**

   The transmitter can install up to eight flight conditions per model.

   ![](image3.png)

   The Condition select function automatically allocates five conditions for helicopter.

   **(General setting)**
   - Normal
   - Idle up1
   - Idle up2
   - Idle up3
   - Hold

   Note: Delete conditions you have not set up and will not use. Otherwise you may accidentally activate them during flight and cause a crash.

   *For a description of the condition deletion, refer to the Condition select function.

   The Normal condition is always on, and remains on until other conditions are activated by switches.

   The priority is throttle hold/idle up 2/idle up 1/normal. Throttle hold has the highest priority.

   Add other conditions, as required.

   The Condition delay can be programmed for each channel. The Condition delay is used to change the servo throw smoothly when switching conditions.

   **(General flight condition setting example)**

   - Normal: (Use initial setting conditions/operate when switch OFF)
     Use from engine starting to hovering.
   - Idle up 1: (Operate at SW-E center)
     Use in 540° stall turn, loop, rolling stall turn, and other maneuvers.
   - Idle up 2: (Operate at SW-E forward side)
     Use in rolls.
   - Throttle hold: (Operate at SW-G forward side)
     Use in auto rotation.
4. Fuselage linkage

Connect the throttle rudder, aileron, elevator, pitch, and other servos in accordance with the kit instruction manual. For a description of the connection method, see "Servos connection by model type".

Note: The channel assignment of the T18SZ is different from that of our existing systems. (The channel assigned to each function can be checked at the Function menu of the Linkage menu.)

• If the direction of operation of the servo is incorrect, use the Reverse function of the Linkage menu. Also use the swash AFR function in other than the H-1 mode.

• Adjust the direction of operation of the gyro. (Gyro side function)

• Connect the throttle linkage so that the carburetor can fully close at full trim throttle cut.

• Adjust the neutral position at the linkage side and fine tune with the Sub-Trim function and End point function (rudder angle adjustment). To protect the linkage, a limit position can also be set with the End point function.

• Swash plate correction (Except H-1 mode)

  *If any interactions are noticed, for a description of the linkage correction function, please refer to the SWASH function.

5. Throttle/Pitch curve setting

This function adjusts the throttle or pitch operation curve in relation to the movement of the throttle stick for each condition.

<Throttle curve setting example>

Call the throttle curve of each condition with the condition select switch.

• Normal curve adjustment

  Normal curve creates a basic throttle curve centered near hovering. This curve is adjusted together with the pitch curve (Normal) so that the engine speed is constant and up/down control is easiest.

• Idle up curve adjustment

  The low side Throttle curve creates a curve matched for aerobatics (loop, roll, 3D, etc.).

• Throttle hold curve adjustment

  The curve is not used when performing auto rotation dives. Confirm that the rate of the slowest position (0%) of the stick is 0% (initial setting).

<Example of pitch curve setting>

Call the pitch curve of each condition with the condition select switch.

• Pitch curve (Normal)

  Make the pitch at hovering approximately +5°~6°. Set the pitch at hovering with the stick position at the 50% point as the standard.

  *Stability at hovering may be connected to the throttle curve. Adjustment is easy by using the hovering throttle function and hovering pitch function together.

• Pitch curve (Idle up 1)

  The idle up 1 pitch curve function creates a curve
matched to airborne flight. Set to $-7^\circ \sim +12^\circ$ as standard.

- **Pitch curve (Idle up 2)**
  The high side pitch setting is less than idle up 1. The standard is $+8^\circ$.

- **Pitch curve (Hold)**
  At auto rotation, use the maximum pitch at both the high and low sides.

**[Pitch angle setting example]**
Throttle hold: $-7^\circ \sim +12^\circ$

6. **AFR (D/R)**

AFR (D/R) function is used to adjust the throw and operation curve of aileron, elevator and rudder for each condition.

*For throttle and pitch curve settings, refer to the above-mentioned “Throttle/Pitch curve setting”

This is normally used after End point has defined the maximum throw directions.

![AFR (Aileron) New Curve](image)

7. **Gyro sensitivity and mode switching**

The gyro sensitivity and mode switching function is dedicated gyro mixing of the Model menu, and can be set for each condition.

![Gyro Sensitivity and Mode Switching](image)

- Normal condition (hovering): Gyro sensitivity maximum
- Idle up 1/Idle up 2/Throttle hold: Gyro sensitivity minimum
- However, at auto rotation of a tail-driven helicopter, this function may not have any effect at high gyro sensitivity.

8. **Throttle hold setting**

*If throttle hold is necessary, please refer to the Throttle hold function.

9. **Throttle cut setting**

Throttle cut provides an easy way to stop the engine, by flipping a switch with the throttle stick at idle. The action is not functional at high throttle to avoid accidental dead sticks. The switch’s location and direction must be chosen, as it defaults to INH.

10. **Swash Mix corrects aileron, elevator and pitch interaction**

The swash mixing function is used to correct the swash plate in the aileron (Left/Right Cyclic) and elevator (Forward/Aft Cyclic) direction corresponding to each operation of each condition.

11. **Throttle mixing setting**

*If throttle mixing is necessary to compensate for engine slowing caused when the swash plate operates at the same time as ailerons or elevator, please refer to the Throttle mixing function.

12. **Other special mixings**

- **Pitch to Needle mixing**
  This mixing is used with engines that allow needle control during flight (fuel-air mixture adjustment). A needle curve can be set. The needle servo rise characteristics at throttle stick acceleration/deceleration operation can be adjusted. (Acceleration function)

- **Governor mixing**
  This mixing is dedicated governor mixing when a governor is used. Up to 3 rates (speeds) can be switched for each condition.
**Servo connection by model type**

The T18SZ transmitter channels are automatically assigned for optimal combination according to the type selected with the Model type function of the Linkage menu. The channel assignment (initial setting) for each model type is shown below. Connect the receiver and servos to match the type used.

*The set channels can be checked at the Function screen of the Linkage menu. The channel assignments can also be changed. For more information, read the description of the Function menu.

### Airplane/glider

*For Normal tail and V tail*

</table>
The System menu sets up functions of the transmitter. This does not set up any model data.

- When the System menu button is tapped, the menu shown below is called up. Tap the function button that you want to enter.

System menu functions table

- **[Display]**: Display adjustment.
- **[Sound volume]**: Adjust the volume of: Other sound, Warning, Voice
- **[Date and Time]**: Sets the date and time (system clock setting) and resets the system timer.
- **[Calibration]**: J1-J4 sticks correction can be performed.
- **[Battery]**: Battery alarm voltage setting. Auto power off time setting.
- **[Range check]**: The output of the transmitter is lowered, for Range checking.
- **[S.Bus servo]**: S.Bus servo setting.
- **[Information]**: Sets the User name, Language, and Unit system. Displays the program version, and SD card information.
Display

The following LCD screen adjustments:

- Backlighting brightness adjustment
- Backlighting decrease time adjustment
- Touch screen calibration

1. Tap the [Display] button in the System menu to call the setup screen shown below.

- Return to System menu

**Backlight max. brightness adjustment**

1. Adjust the backlighting brightness with the value input buttons.

   *When the ▲ button is tapped, the backlighting becomes brighter. When the ▼ button is tapped, the backlighting becomes darker.*

**Backlight min. brightness adjustment**

1. Adjust the backlight decrease brightness with the value input buttons.

   *When the ▲ button is tapped, the backlighting becomes brighter. When the ▼ button is tapped, the backlighting becomes darker.*

   *It cannot be made brighter than Backlighting brightness adjustment.*

**Backlight decrease time**

1. You can set a time period to decrease the LCD backlight. This function counts the period that the Touch Panel has been not operated. This time can be set by ten-second steps. You can also turn off the backlight decrease* if you like.

   *The backlight consumes a large amount of power. We recommend that you turn off the backlight by setting the backlight power-off time to about one minute.*

---

**Touch calibration**

This function adjusts the location of the Touch Panel. Press the "Touch calibration" button. The calibration screen will then pop up. Tap the center of the cross hair cursor on the screen with the soft pen. As soon as the system recognizes the position, the cursor will move on to the next position. Repeat this procedure as long as the cursor moves to next position. You will do this five times. Calibration will be carried out based on the five positions. Disappearance of the cross hair cursor means the calibration has been completed.

*In ordinary operation, this calibration is not necessary. If you notice the Touch Panel is not functioning correctly after long use, we recommend that you carry out this calibration.*
Sound volume

This function can set the volume of "Other sound" "Warning" "Voice" respectively.

- Tap the [Sound volume] button in the System menu to call the setup screen shown below.

Sound volume Setting method
1. When the Sound volume box is tapped, the above screen will appear.

2. You can change the sound volume by tapping the "▲" "▲" "▼" "▼" button of four items.
   *If you tap "▲", the volume will increase. If you tap the "▼", the volume will decrease.

Date and Time

This function adjusts the system clock of the T18SZ transmitter. Perform this setting when you purchase the set and when adjustment is necessary.

- Tap the [Date and Time] button in the System menu to call the setup screen shown below.

Date setting
1. Tap the "Year", "Month", or "Day" button and set the date by tapping the "▲" "▲" "▼" "▼" "▼" button.
2. Tap "Time adjust", the timer is renewal.

Time setting
1. Tap the "Hour" "Minute" or "Second" button, and set the time by tapping the "▲" "▲" "▼" "▼" "▼" button.
2. Tap “Time adjust”, the timer is renewal.

The system timer can also be reset.

*The system timer is displayed on the Home screen.
*When a battery is removed, a clock functions for several hours.
*When removing a battery long time, a clock is reset.

System timer reset
The system timer shows the total time that has elapsed since the last "reset".
1. Tap "Total" or "Model", to reset is chosen.
2. When the [System timer] button is tapped.
3. Tap “Yes” in the next screen, the timer is reset.
H/W setting

Usually, this calibration is unnecessary.
Please perform this calibration only if a change at the center of a stick should arise after prolonged use.

- Tap the [H/W setting] button in the System menu to call the setup screen shown below.

**How to Calibrate**

1. Choose the stick to calibrate right and left.
2. The stick is set at neutral and the [Set neutral] button is tapped.

3. The stick is held at full right and full bottom (diagonal). The [Set endpoint] button is tapped.
4. The stick is held at full left and full top (diagonal). The [Set endpoint] button is tapped.

*Please do not press the stick too firmly in any direction when doing the calibration.

*Check after calibration to make sure that neutral is 0%, the bottom right side is +100%, and the top left side is -100%.
Battery

Select the battery alarm voltage according to the battery to be used.

Auto power off time setting

*This function prevents battery discharging if the transmitter power supply does not erase.

1. Adjust the auto power off time with the value input buttons.
   *When the time the transmitter is inactive reaches the set time, the power is turned off automatically.
   This time can be set up to 1 hour in 10 minutes increments. The auto power off function can also be deactivated.
   *An audible alarm is sounded from 3 minutes before auto power off. When a stick or switch is operated while the alarm is cleared.

Range Check

The 'range check mode' reduces the transmission range of the radio waves to allow for a ground range check.

*The range check mode, when activated, will continue for 60 seconds unless the user exits this mode early. When the progress bar reaches 60 second mark, the RF transmission automatically returns to the normal operating power.

Refer to P.46
S.Bus servo

An S.BUS(2) servo can memorize the channel and various settings you input. Servo setting can be performed on the T18SZ screen by wiring the servo as shown in the figure.

* With some S.BUS(2) servos, there are some functions which cannot be used. If a function cannot be used, the display screen will change. (Only the function which can be used by a servo is displayed.)

* After reading completion, with connection of the above figure, if a stick is moved, servo operation can be tested.

- Call the following setting screen by pressing the [S.BUS Servo] button in the System menu.

Return to System menu

### Procedure for changing S.BUS servo setting

2. Wire the servo as shown in the figure above.
3. Press [Read]. The ID and current setting of that servo are displayed.

4. When multiple servos are connected change [INH] at the right side of the ID number on the screen to [ACT] and enter the ID of the servo you want to set.
5. Set each item. (Please see the next page.)
6. Press [Write]. The settings are changed.

### Servo ID number

If you use multiple S.BUS servos, only the desired servo in the group can be set by entering the ID of that specific servo.
S.BUS Servo Description of function of each parameter

*There are functions that can and cannot be performed according to the servo type.

• **ID**
  Displays the ID of the servo whose parameters are to be read. It cannot be changed.

• **Channel**
  Channel of the S.BUS system assigned to the servo. Always assign a channel before use.

• **Reverse**
  The direction in which the servo rotates can be changed.

• **Soft Start**
  Restricts operation in the specified direction the instant the power is turned on. By using this setting, the first initial movement when the power is turned on slowly moves the servo to the specified position.

• **Stop Mode**
  The state of the servo when the servo input signal is lost can be specified. The "Hold" mode setting holds the servo in its last commanded position even if using AM or FM system.

• **Smoother**
  This function changes smoothness of the servo operation relative to stick movement changes. Smooth setting is used for normal flight. Select the "OFF" mode when quick operation is necessary such as 3D.

• **Neutral Offset**
  The neutral position can be changed. When the neutral offset is a large value, the servo's range of travel is restricted on one side.

• **Speed Control**
  Speeds can be matched by specifying the operating speed. The speed of multiple servos can be matched without being affected by motor fluctuations. This is effective for load torques below the maximum torque. However, note that the maximum speed will not exceed what the servo is capable of even if the servos operating voltage is increased.

• **Dead band**
  The dead band angle at stopping can be specified.

  **[Relationship between dead band set value and servo operation]**
  Small → Dead band angle is small and the servo is immediately operated by a small signal change.
  Large → Dead band angle is large and the servo does not operate at small signal changes.

  **(Note)** If the dead band angle is too small, the servo will operate continuously and the current consumption will increase and the life of the servo will be shortened.

• **Travel Adjust**
  The left and right travels centered about the neutral position can be set independently.

• **Boost**
  The minimum current applied to the internal motor when starting the servo can be set. Since a small travel does not start the motor, it essentially feels like the dead band was expanded. The motor can be immediately started by adjusting the minimum current which can start the motor.

  **[Relationship between boost set value and servo operation]**
  Small → Motor reacts to a minute current and operation becomes smooth.
  Large → Initial response improves and output torque increases. However, if the torque is too large, operation will become rough.
• Boost ON/OFF
   OFF : It is the boost ON at the time of low-speed operation.(In the case of usual)
   ON : It is always the boost ON.(When quick operation is hope)

• Damper
   The characteristic when the servo is stopped can be set.
   When smaller than the standard value, the characteristic becomes an overshoot characteristic. If the value is larger than the standard value, the brake is applied before the stop position.
   Especially, when a large load is applied, overshoot, etc. are suppressed by inertia and hunting may occur, depending on the conditions. If hunting (phenomena which cause the servo to oscillate) occurs even though the Dead Band, Stretcher, Boost and other parameters are suitable, adjust this parameter to a value larger than the initial value.

[Relationship between damper set value and servo operation]
Small → When you want to overshoot. Set so that hunting does not occur.
Large → When you want to operate so that braking is not applied. However, it will feel like the servo response has worsened.
(Note) If used in the hunting state, not only will the current consumption increase, but the life of the servo will also be shortened.

• Stretcher
   The servo hold characteristic can be set. The torque which attempts to return the servo to the target position when the current servo position has deviated from the target position can be adjusted.
   This is used when stopping hunting, etc., but the holding characteristic changes as shown below.

[Relationship between stretcher and servo operation]
Small → Servo holding force becomes weaker.
Large → Servo holding force becomes stronger.
(Note) When this parameter is large, the current consumption increases.

• Buzzer
   When the power supply of a servo is previously turned on at the time of a power supply injection without taking transmit of a transmitter, the buzzer sound of about 2.5 Hz continues sounding from a servo.
   (Even when the transmit of a transmitter is taken out previously, a buzzer becomes until the signal of a servo is outputted normally, but it is not unusual.)

   The transmitter has been turned OFF ahead of a servo power supply → The buzzer sound of about 1.25 Hz continues sounding as servo power supply end failure alarm.
   (Do not insert or remove the servo connector while the receiver power is ON. A buzzer may sound by incorrect recognition.)
   ※ Buzzer sound is generated by vibrating the motor of a servo.
   Since current is consumed and a servo generates heat, please do not operate the number more than needed or do not continue sounding a buzzer for a long time.

⚠️ WARNING
⚠️ While S.BUS servo writes, you aren’t supposed to remove a connection of a servo and turn off a power supply of a transmitter.
   ■ Data of S.BUS servo is damaged and breaks down.

⚠️ WARNING
⚠️ Do not use the S.I/F (S.BUS servo setup) connector with anything other than high-voltage-capable servos.
   ■Transmitter battery voltage is conveyed directly. Using anything other than high-voltage-capable servos presents the danger that they will break.
The program version, and SD card size are displayed. The User name, language and Unit system used by the system can also be changed.

This function registers the T18SZ user name and the language displayed at proportional can be changed.

Telemetry numerical values can be displayed in either metric or SAE (yard-pound) units.

The Information screen displays the T18SZ system program version information, SD card (memory size, card free size) information.

*If an SD card is not inserted, no memory card information will be displayed.

- Tap the [Information] button at the System menu to call the setup screen shown below.

**Telemetry Display Unit**

* [Metric]  
  - Distance --- m (meter)  
  - Speed --- km/h (kilometers per hour)  
  - Variometer --- m/s (meter per second)  
  - Temperature --- °C (centigrade)  

* [Yard]  
  - Distance --- yard  
  - Altitude --- feet  
  - Speed --- mph (mile per hour)  
  - Variometer --- fpm (ft per min)  
  - Temperature --- °F (fahrenheit)

**Registration of the user’s name**

T18SZ transmitter can register user’s name.

**How to register user’s name**

1. Turn on the power of the transmitter.
2. Select “user’s name” and then the keyboard will pop up.
3. You can use up to 15 characters as a user’s name. Use the keyboard on the screen to enter user’s name.
The Linkage menu is made up of functions which perform model addition, model type selection, end point setting, and other model basic settings.

- Tap the [Linkage menu] button in the Home screen to call the setup screen shown below.
- Select the function name and return to the Home screen.

**Linkage menu functions table**

- **[Servo monitor]**: Displays the servo test and operation position
- **[Model select]**: Model addition, call, deletion, copy, model name setting
- **[Model type]**: Model type, wing type, tail type, swash type, selection
- **[Servo reverse]**: Servo direction reversal
- **[End point]**: Servo basic rate adjustment and limit setting
- **[Servo speed]**: Servo speed setting
- **[Sub-trim]**: Adjusts the neutral position of each servo
- **[Function]**: Channel assignment of each function can be changed
- **[Fail safe]**: Fail safe function and battery fail safe function setting
- **[System type]**: System mode selection, link of a transmitter and receiver, telemetry mode selection
- **[T1-T6 setting (Trim)]**: Control step amount and mode selection of the digital trim
- **[Throttle cut]**: Stops the engine safely and easily
- **[Idle down]**: Lowers the idle speed of the engine
- **[Swash ring]**: Limits the swash plate travel to within a fixed range. (helicopter only)
- **[Swash]**: Swash AFR and linkage correction function (helicopter only)
- **[Stick alarm]**: Can be set so that an audible alarm sounds when the throttle stick reaches the set position.
- **[Timer]**: Timer setting
- **[Function name]**: Function name can be changed
- **[Sensor]**: Various telemetry sensors setting
- **[Telemetry]**: Displays various data sent from the receiver
- **[Tele.setting]**: Telemetry data log
- **[Trainer]**: Starts and sets the trainer system.
- **[Warning setting]**: Mixing, throttle position warning reset
- **[User menu setting]**: Original menu making
- **[Date reset]**: Model memory set data reset (by item)
Servo Test & Graph Display / Displays servo positions.

Servo monitor

This is used for testing servo movement. “Moving Test” (repetition mode) and “Neutral Test” (fixed position mode) are available.

The “Neutral Test” is good for finding the neutral position of a servo horn.

- Select [Servo monitor] at the linkage menu and call the setup screen shown below.

Test mode change:
OFF → Neutral → Moving

Select the [OFF] or pushing the HOME/EXIT button → Testing is stopped

WARNING

Don’t set a servo test mode when the drive motor is connected and the engine has been started.

- Inadvertent rotation of the motor or acceleration of the engine is extremely dangerous.
**Model select**

The Model selection function performs model addition, call, deletion, copy, and model name setting.

This function is used to load the settings of the desired model into the T18SZ’s memory.

The settings may be selected from either the transmitter’s built-in memory or a SD card (32MB-2GB). Remember that up to 30 model memories are available in the transmitter.

The name of the model stored in the transmitter and the SD card may be changed. This can be very useful to tell different models settings apart. Each model name can be as long as 15 characters, and the model name always appears in the display screen.

The Copy function is used to copy one set of model data into a second memory within the transmitter and the SD card. It may be used for getting a head-start on setting up models with almost the same settings (only differences need to be modified, instead of entering the complete model from scratch). Also, this function may be used to make a backup copy of a model setup before any changes are made.

- Select [Model select] at the linkage menu and call the setup screen shown below.

  ![Image](image.png)

  - Tap the [Model select] button in the Home screen to call the setup screen shown below.

  ![Image](image.png)

  - Return to Home or Linkage menu

  ![Image](image.png)

  - Current model is green.

**Model addition**

1. Tap the [New] button.

2. Tap [Yes] to add the model. (When you want to cancel model addition, tap [No].)

*The added model is displayed in the model list.
*When a model is added, a receiver link is required.
Model call

1. Tap the Internal or SD card. Select the location to which the desired model is to be saved.
2. Tap the desired model in the model list.
3. Tap the [Select] button.
4. Tap [Yes] to call the model. (When you want to cancel model call, press [No].)

Model deletion

1. Tap the select model name or the model you want to delete in the model list.
   (The model currently selected cannot be deleted.)
2. Tap the [Delete] button.
3. Tap [Yes]. (When you want to stop model deletion, tap [No].)
**Model name change**

1. The model data chosen at current model can be changed. The current model name, tap.
2. When [Rename] is tapped, a keyboard appears on the screen.
3. Enter the model name from this keyboard.
   *Up to 15 characters can be input at the model name.

**WARNING**

Never launch the Model Selection function while the engine is starting or the motor drive wiring is connected.

Careless spinning of propellers or rotors is extremely dangerous.

**WARNING**

Carefully check that the aircraft to be used and the model selected match up.

Using a model which does not match the aircraft runs the risk of the aircraft flying out of control and crashing. Perform a careful operations check prior to flight.

**Model copy**

1. The model data chosen at current model can be copied. The current model name, tap.
2. Tap the "Copy" button and tap the destination button and select the copy storage destination. (Internal or SD card)
3. When [Internal] or [SD card] is tapped, copying is executed.

*If there is no model with the same name in the copy destination, the name of the copied model is saved. If there is a model of the same name, a number is added at the end of the model name and the model is copied. You can change the name later.

*Indication date : When the model data is copied, the creation date for the current model is recorded.
Model type

This function selects the model type from among airplane, glider, helicopter, and multicopter.

Seven types of main wings (six types of flying wing) and three types of tail wings are available for airplanes. Eight swash types are available for helicopters. Seven types of main wings and three types of tail wings are available for gliders. Functions and mixing functions necessary for each model type are set in advance at the factory.

Note: The Model Type function automatically selects the appropriate output channels, control functions, and mixing functions for the chosen model type.

When the Model Type Selection command is accessed, all of the data in the active memory is cleared. Be sure that you don’t mind losing this data, or back it up to another memory using the copying functions.

(The display screen is an example. The screen depends on the model type.)

• Select [Model type] at the linkage menu and call the setup screen shown below.

Return to Linkage menu

Model type selection

1. Model type selection [Model icon], tap.

2. Set the Model type, Wing type(Airplane/Glider), Tail type(Airplane/Glider), or Swash type(Helicopter) by using the appropriate button.

3. Set the type you choose by tapping [Enter] → [Yes] at the confirmation screen. (When you want to cancel model type selection, tap [No].)

• When a data change will occur, the confirmation screen of data initialization menu will be displayed. A push on [yes] will initialize data and allow changes. A push on [no] will stop data changes.
Servo Reverse

Use to reverse the servo throw direction.

Servo Reverse changes the direction of an individual servo’s response to a control stick movement.

For CCPM helicopters, be sure to read the section on Swash AFR before reversing any servos. With CCPM helicopters, always complete your servo reversing prior to any other programming. If you use pre-built Airplane/Glider functions that control multiple servos, it may be confusing to tell whether the servo needs to be reversed or a setting in the function needs to be reversed. See the instructions for each specialized function for further details. Always check servo direction prior to every flight as an additional precaution to confirm proper model memory, hook ups, and radio function.

⚠️ WARNING

⚠️ Before a flight, it always check that your model’s servo operation, the direction of control surfaces, and switch setup are correct.

⚠️ Default setting of the throttle/motor channel is always reverse.

- Tap the [Servo reverse] button in the Linkage menu to call the setup screen shown below.

(&Return to Linkage menu)

(The display screen is an example. The screen depends on the model type.)

Servo reversing procedure

After setting up a new model, be sure to define all special menus. Be sure that all servos are plugged into the proper receiver channels. Now, determine whether you need to reverse any channels by moving each stick and observing the corresponding movement in the model’s controls.

1. Tap the desired channel’s setting button to choose the proper direction for the servo.
2. Tap “Yes” in the next screen.
3. Repeat for each servo needing reversal.

When done, tap “Servo reverse” to return to the Linkage menu.

74 < Linkage menu >
**End point**

Sets the travel, limit point.

The End point function adjusts the left and right servo throws, generates differential throws, and will correct improper linkage settings.

The travel rate (normal full stick movement at high rates) can be varied from 30% to 140% in each direction on channels 1 to 16. Also, the limit point (how far the servo travels when a mix is involved) where servo throw stops may be varied from 0% to 155%.

---

**Servo travel adjustment**

1. Tap the travel button of the channel you want to set. Value input buttons appear on the screen.
2. Use these buttons to adjust the rate.
   - Initial value: 100%
   - Adjustment range: 30%~140%
3. Repeat the procedure above for each rate.

**Limit point adjustment**

1. Tap the limit button of the channel you want to set.
2. Use the value input buttons to adjust the limit point.
   - Initial value: 135%
   - Adjustment range: 0%~155%
3. Repeat this procedure for each limit point.

---

(The display screen is an example. The screen depends on the model type.)
Servo speed

Sets the speed of each servo.

The Servo speed setting is used to set the servo delay for each channel, from channel 1 to channel 16. The system uses the programmed speed (delay) to slow down servo position changes. The Servo speed setting can be varied from 0 to 27 in each channel.

- Tap the [Servo speed] button in the Linkage menu to call the setup screen shown below.

| Servo speed setting | 1. Tap the speed button of the channel you want to set.  
|---------------------|---------------------------------------------------------|
|                     | 2. Use the value input buttons to adjust the servo speed.  
|                     |   • Initial value: 0                                     |
|                     |   • Adjustment range: 0~27 (steps)                      |
|                     | 3. Repeat this procedure for each channel.              |

Tap the [Servo speed] button in the Linkage menu to call the setup screen shown below.

Sub-trim

Setting of neutral position of each servo.

The Sub-Trim function is used to set the servo neutral position, and may be used to make fine adjustments to the control surface after linkages and pushrods are hooked up. When you begin to set up a model, be sure that the digital trims are set to their center position.

- Tap the [Sub-trim] button in the Linkage menu to call the setup screen shown below.

| Sub-trim adjustment | 1. Tap the trim display part of the channel you want to adjust.

Function

Channel assignment for each function can be changed to suit your needs.

When you select model and wing (swash) types, you will find that the optimized combinations of servo output channels and functions have been already preset. If you would like, on the function-setting screen of the linkage menu, you can freely change combinations of servo output channels, functions (ailerons, elevator, etc), and input controllers (sticks, switches, trim levers and trim switches). You can also assign the same function to multiple servo output channels such as assigning elevator function to CH2 and CH3.

DG1, DG2 (switch channels)
These two channels can be used as switch (On/Off) channels. You can freely change combinations between servo output channels and input controllers (sticks, switches, trim levers and trim switches).

Channel restrictions by a System Type
FASSTest 18CH---16 CH+2 Switch
FASSTest 12CH---10 CH+2 Switch
FASST MULTI ---16 CH+2 Switch
FASST 7CH --- 7 CH
S-FHSS --- 8 CH
T-FHSS --- 16 CH+2 Switch

Function change
1. Tap the function button of the channel you want to change to call the Function select.
2. Select the function you want to change.

Operation control change
1. Tap the control button of the channel you want to change. A control select screen (stick, switch, knob, trim lever, etc.) is displayed.
2. Select the control you want to operate.
   *The same control can be assigned to multiple channels.
Trim change

1. Tap the trim button to call the trim setup screen.

<table>
<thead>
<tr>

<td>RD SE</td>
<td>T5</td>
</tr>
<tr>
<td>Mode</td>
<td>+30 Normal</td>
<td>T6</td>
</tr>
</tbody>
</table>

2. The following items can be set at the trim setup screen.
- Hardware setting (Selection of switch, etc. which controls trim)
- Rate setting
- Trim mode setting
  - Normal mode: Normal trim (linear) operation
  - ATL mode: ATL operation mode. (Works at only one end of operation) Reverse is also possible.
  - Center mode: Maximum change near center by center trim operation (Does not change at end of the stick movement)

The Motor function is used when switching the motor ON/OFF (mostly for motor gliders). For most EP plane, the throttle can be left as-is when controlling the motor by stick. This means that the various throttle-related functions are usable via motor control.

H/W reverse

This function reverses the operation signal of the sticks, switches, trimmer levers, and knobs.

Note: This setting reverses the actual operation signal, but does not change the display of the indicators on the display. Use the Normal mode as long as there is no special reason to use the reverse mode.
Fail safe

Sets the servos' operating position when transmitter signals can no longer be received or when the receiver battery voltage drops.

The Fail safe function is used to set up positions that the servos will move to in the case of radio interference. Defines servo position when signals are lost and when receiver battery voltage becomes low.

You may set either of two positions for each channel: Hold, where the servo maintains its last commanded position, or fail safe, where each servo moves to a predetermined position. You may choose either mode for each channel.

The T18SZ system also provides you with an advanced battery monitoring function that warns you when the receiver battery has only a little power remaining. In this case, each servo is moved to the defined failsafe position. The battery failsafe may be released by operating a predefined control on the transmitter (default is throttle). Do not continue to fly. Land as soon as possible. Remember, if the predefined control suddenly moves to a position you did not command, land at once and check your receiver battery.

**Do not continue to fly. Land as soon as possible.** Defines servo position when signals are lost and when receiver battery voltage becomes low.

---

**WARNING**

For safety, always set the fail safe functions.

- Especially set the throttle channel fail safe function so that the servo moves to the maximum slow side for airplanes and to the slow side from the hovering position for helicopters. Crashing of the model at full high when normal radio waves cannot be received due to interference, etc., is very dangerous.
- If fail safe is reset by throttle stick movement, the fail safe may be mistaken as an engine malfunction and will be reset at low throttle and the model will continue to fly. If you have any doubts, immediately land.

---

**Fail safe setting procedure**

Decide which channels you want to go to preset positions, and which ones you want to maintain their last commanded position. To select the fail safe mode you wish to set, use the F/S button. This button toggles between the two modes. (Hold, F/S)

**F/S mode setting:**

1. Tap the F/S button of the channel you want to set, and set that channel to the [F/S] mode.
2. Hold the corresponding stick, control, slider, or other control in the position you want the servo to move to when the fail safe function is activated, and tap the F/S position button. That position is displayed in percentage.

*When you want to return that channel to the Hold mode, tap the [F/S] button again.

**Battery fail safe setting procedure**

To select the B.F/S mode, tap the [B.F/S] button. Each time the button is tapped, it toggles between [OFF] and [B.F/S].

**B.F/S setting:**

1. Tap the [B.F/S] button of the desired channel to set it to the B.F/S mode.
2. Hold the corresponding stick, VR, slider, or other control in the position you want the servo to move to when the battery fail safe function is activated, and tap the F/S position button. This position is displayed in percentage.

*When you want to return that channel to OFF, tap the [B.F/S] button again.

**Battery Fail safe release function**

This function releases the predefined control from its held position after indicating that your receiver battery is low.

1. Enter the control setting screen by tapping the Battery F/S release button. Now, you may choose whether moving the throttle resets the condition, or select a stick or switch to deactivate it. To set a desired throttle release position, move the throttle stick to the point at which you wish the B.F/S to be released.
System type

System Type selection

The T18SZ is for 2.4GHz only. The system can be changed from among 6 choices: FASSTest 18CH, FASSTest 12CH, FASST MULTI, FASST 7CH, T-FHSS, S-FHSS. It is FASSTest18CH and FASSTest12CH which can be chosen by R7008SB set. The method of selection is to the next page.

*If you change the System type, other model data is not reset.
*After any change, remember to test the model and fully check servo direction and motion.
*Analog servos cannot be used with the R7008SB in the FASSTest 12CH mode.

Return to Linkage menu

Select [System type] in the Linkage menu and access the setup screen shown below.

Dual receiver function (only FASSTest 18CH mode)

Dual receivers can be linked with the T18SZ. Two receivers are recognized individually by ID numbers. For example, in R7008SB, CH output setting function is used, by setting the first as as “1-8CH”, and setting the second as “9-16CH”. Two sets of receivers can be used as a set in the model, allowing you 16 channels. Separate fail-safe voltage can be set to each receiver.

However, telemetry cannot be used for the 2nd receiver.

Telemetry function (FASSTest / T-FHSS mode)

To use the telemetry function, set “Telemetry” to “ACT”.

DL Interval (only FASSTest mode)

When a telemetry function is enabled, the receiving interval (down-link interval) of sensor data can be changed.

If a DL interval is increased, the response of the sensor data display becomes slower, but stick response will improve.

Battery fail-safe voltage setup (FASSTest / T-FHSS mode)

The voltage at which battery fail-safe activates can be set when you link. (3.5-8.4V) The receiver memorizes the setting as it was at link.

Since power consumption varies with battery type, servos and condition, please select the fail-safe activation voltage for your own model.

Receiver linking

The receiver will only be controlled (without being affected by other transmitters) by the transmitter it is linked to. When using a receiver other than one purchased as a set, linking is necessary.

Moreover, a re-link is required when a new model is added by model selection, and at the time of system type change.

Linking method

P.43

Cases when linking is necessary:
- When using a receiver other than the initial setting.
- When the communication system was changed. (FASSTest18CH ↔ FASSTest12CH etc.)
- When a new model was created by model selection.
The example for choosing System Type

- Analog servos cannot be used with the R7008SB in the FASSTest 12CH mode.

System type

- **FASSTest 18CH** --- FASSTest system receiver mode. Applicable with the telemetry sensor unit. Up to 18 channels (linear 16+ON/OFF2) can be used.

- **FASSTest 12CH** --- FASSTest system receiver mode. Applicable with receiver voltage display. Up to 12 channels (linear 10+ON/OFF2) can be used. Telemetry Sensor cannot be used, but the response speed is faster than that of the 18CH mode.

- **FASST MULTI** --- FASST-MULTI system receiver mode. Up to 18 channels (linear 16+ON/OFF2) can be used.

- **FASST 7CH** --- FASST-7CH system receiver mode. Up to 7 channels can be used.

- **T-FHSS Air** --- T-FHSS system receiver mode. Applicable with the telemetry sensor unit. Up to 18 channels (linear 16+ON/OFF2) can be used.

- **S-FHSS** --- S-FHSS system receiver mode. Up to 8 channels can be used.

(Usable receivers) (The time of august, 2015)
**T1-T6 setting (Trim)**

This function adjusts the digital trim's control step amount and operation mode (T1-T6.)

- Select [T1-T6 setting] at the linkage menu and call the setup screen shown below.

**Control step amount setting**

1. The [Step] item tap the screen to the data input mode.

   Set the control step amount by tapping the "△△△△△△ " button.

   Initial value: 4

   Adjustment range: 1~200

   (When the value is tapped, the control step amount is reset to the initial value.)

   *When the value is made large, the change per step becomes larger.

**Separate/combination mode selection**

- **[Comb.]** Combination mode. The trim data are reflected at all the flight conditions.
- **[Separ.]** Separate mode. Trim adjustment for each flight condition.

When the flight conditions are set, the trim operation can be coupled with among all the conditions which combination mode is selected.
**Throttle cut**  
Stops the engine safely and easily.

Throttle cut provides an easy way to stop the engine, by flipping a switch with the throttle stick at idle. The action is not functional at high throttle to avoid accidental dead sticks. The switch’s location and direction must be chosen, as it defaults to "— — ".

- Tap the [Throttle cut] button in the Linkage menu to call the setup screen shown below.

![Throttle cut setting procedure](image)

1. Tap the "INH" button.
2. Throttle cut function switch setting:
   Tap the "—" button to call the <Hardware select> screen, and then select the switch and its ON direction.
   (For a detailed description of the selection method, see [Switch selection method] at the back of this manual.)
3. Throttle cut position setting:
   Tap the cut position button. Value input buttons appear on the screen.
   Use these buttons to adjust the cut position rate.

- Initial value: 17%
- Adjustment range: (LOW) 0%~50% (Middle)

*With throttle stick at idle, adjust the rate until the engine consistently shuts off.

To exit the setting, tap the [Throttle cut] button.
Idle down

Lowers the engine idling speed.

The Idle down function lowers the engine's idle by flipping a switch with the throttle stick at idle. The action is not functional at high throttle to avoid accidental dead sticks. The switch’s location and direction must be chosen, as it defaults to "— — ".

- Select [Idle down] at the linkage menu and call the setup screen shown below.

Idle down setting procedure

1. Tap the "INH" button to activate the Idle down function.
2. Idle down function switch setting:
   - Tap the "--" button to call the <Hardware select> screen, and then select the switch and its ON direction.
   (For a detailed description of the selection method, see [Switch selection method] at the back of this manual.)
3. Offset rate setting:
   - Tap the offset rate button. Value input buttons appear on the screen.
   - Use these buttons to adjust the offset rate.
   - Initial value: 0%
   - Adjustment range: -100%~100%
   *(--) becomes an idle up.

To exit the setting, tap the [Idle down] button.
Swash ring

Limits the swash travel within a fixed range to prevent linkage damage (Helicopter only)

This function limits the travel of the swash plate to prevent linkage damage as the aileron and elevator operation is used. It is useful for 3D heli setting.

- Tap the [Swash ring] button in the Linkage menu to call the setup screen shown below.

Swash ring setting procedure

1. Push the Swash ring button on the linkage menu.
2. Push ACT/INH button to activate.
   * The movement area monitor shows the current aileron and elevator values and limit ranges by the yellow circle.
3. Adjust the rate to the maximum amount of swash plate decline.
   * The swash movement is limited within the circle.
   Adjustment range: 50 - 200%.
Neutral Point

At your linkages, if the servo horn deviates from a perpendicular position at neutral, the linkage compensation functions in this menu may not compensate effectively. To correct this use the neutral point function. This will move the neutral point of the servos to the actual perpendicular position. However, this adjustment changes only the axis point of the compensation functions in this menu, and does not affect the neutral position of other functions.

Swash AFR

Swash AFR function reduces/increases/reverses the rate (travel) of the aileron, elevator and collective pitch functions, by adjusting or reversing the motion of all servos involved in that function, only when using that function.

Swash operation linkage correction function (helicopter only, except swash type H-1).

Mixing Rate

This compensation mixing is used to correct the tendency of the swash-plate for each control. The following compensation mixing is possible; PIT to AIL, PIT to ELE, AIL to PIT, ELE to AIL, and ELE to PIT (HR3 mode.) It adjusts the swash-plate to operate correctly for each control using the corresponding compensation mixing.

Linkage Compensation

This compensation mixing is used to correct the tendency of the swash-plate for pitch control at low pitch and high pitch.

Speed Compensation

This function is used to cancel the reaction that is generated by the difference of the operation amount of each servo when the swash-plate moves.

Select [Swash] at the linkage menu and call the setup screen shown below.

Return to Linkage menu
Neutral point setting procedure

* Becomes the compensation reference point.
* Adjusting the servo horn so that the neutral point position is near the 50% position makes the mixing amount small.

1. Hold the servo horn at a right angle to the linkage rod, and then tap the [Enter] button and read the actual neutral point.
* The neutral point is displayed on the screen.

After reading this neutral point, use other compensation functions to make further adjustments.
To exit the setting, tap the [Swash] button.

Swash AFR setting procedure

Adjust so that the specified operation amount is obtained by aileron, elevator, and pitch operation.

1. Tap the button of the AFR rate to be adjusted. Value input buttons appear on the screen.
2. Use the value input buttons to adjust the AFR rate.
   Initial value: +50%
   Adjustment range: -100%~+100%
   + or - the direction of operation changes.
To exit setting, tap the [Swash] button.

Mixing rate setting procedure

HR-3 is described as an example. The mixing applied in other swash modes is different, but the setting procedure is the same.

1. Set the throttle stick to the set neutral point.
   Adjust the length of the linkage rod so that the swash plate is horizontal at this position.
   * A little adjustment using sub trim should be OK.
   * Adjust so that pitch operation when the pitch curve is straight is maximum.
2. Adjust the AIL->PIT amount so there is no interference in the elevator or pitch direction when the aileron stick is moved to the left and right.
   * Adjust the left and right sides separately.
3. Adjust the ELE->AIL and ELE->PIT amounts so there is no interference in the aileron or pitch direction when the elevator stick is moved up and down.
   * Adjust the up and down sides separately.
4. Adjust the PIT->AIL and PIT->ELE amounts so that the swash plate is horizontal when the throttle stick is set to maximum slow and full high.
   * Adjust the slow and high sides separately.
To exit setting, tap the [Swash] button.

Linkage correction setting procedure

* Set the linkage compensation after setting the mixing rate.
* This function compensates for elevator interference by aileron operation or aileron interference by elevator operation at Low pitch and Hi pitch at collective pitch (HR3, etc.) control.

1. Set the throttle stick to the maximum slow position. Move the aileron stick to the left and right and adjust the aileron compensation amount so that interference in the elevator or pitch direction at that time is minimal.
* The left and right sides can be adjusted separately.
* If the interference increases when the compensation amount is increased, make the compensation direction "-".
2. Adjust the elevator compensation amount so that the interference in the aileron or pitch direction when the elevator stick was moved up and down is minimal.
3. Perform aileron and elevator compensation similarly for the throttle stick full high side.
To exit setting, tap the [Swash] button.

Speed compensation setting procedure

1. Set the throttle stick to the neutral point position. Move the elevator stick quickly and adjust the speed compensation amount so that interference in the pitch direction is minimal.
To exit setting, tap the [Swash] button.

Notes:
If the linkage is too long or short, correct compensation will not be applied. Correct this before continuing. The pitch angle changes after any adjustment. Reset the pitch angle when actually flying after compensation processing.
Stick alarm

An alarm (single beep) can be sounded at the specified throttle stick position.

- Alarm function ON/OFF can be set by switch.
Timer

The Timer function may be set for any desired time, i.e. engine run time, specified times for competitions, etc. Two independent timers are provided for your use. The timers are stored independently with each model, meaning that when you switch between model setups, the timer associated with the new model is brought up automatically.

The timers may be set to start and stop from the motion of any switch or stick. You may set the ON and OFF directions freely. Each timer has a capacity of up to 59 minutes 59 seconds.

- Select [Timer] at the linkage menu and call the setup screen shown below.

   ![Timer setup screen]

   - [Inhibit] → [Type1-4]
     If it carries out like this, a vibration function will work.

   - Return to Linkage menu

   - Up timer/Down timer selection
     1. Tap the mode button and select the type of timer.
     2. Timer time setting.
        Tap the Mode minutes or seconds button. Value input buttons appear on the screen. Use these buttons to set the timer time.

   - Start/Stop/Reset switch setting
     1. Tap the Start/Stop/Reset SW "--" button to call the <Switch> screen, and then select the switch and its ON direction.
        (For a detailed description of the selection method, see [Switch selection method] at the back of this manual. The timer switches can be set for each condition.)

   - Each timer may be set for count-down or count up operation with a target time.
   - If a target time is set and the timer reaches the set time, a buzzer sound for each count is generated.

   ![Time and Alarm settings]

   - Off: Turning the power OFF and switching models will reset the timer.
     On: Previous timer is put into memory and will restart from where it stopped.

   - Elapsed: Minute-by-minute alarm starting from 00:00
     Remainder: Minute-by-minute alarm counting down from a designated time
Function name

The name of the spare functions (Auxiliary 1-8) can be changed for the full name (10 characters) or for the abbreviated name (4 characters).

- Tap the [Function name] button in the Linkage menu to call the setup screen shown below.

Return to Linkage menu

Function name change method

1. Select [Function name] of the Linkage menu and tap the screen.
2. The Function name setup screen is displayed.
3. When the function whose name is to be changed is selected and the screen is tapped, a modification screen is displayed.
4. Select the function to be renamed and select [Rename] and tap the screen. A character input screen is displayed. Input the function name.
5. When [Reset] is selected and the screen is held down, the function name is set to the initial state function name.

6. The function name may be displayed in 10 characters or 4 characters, depending on the setup screen. For 4-character display, input the function name as required.
Telemetry system

This screen displays and sets the various information from the receiver. An alarm and vibration can be generated depending on the information. For example, a drop in the voltage of the receiver battery housed in the aircraft can be reported by an alarm.

- This function can only be used in the FASSTest 18CH mode and T-FHSS mode. The FASST/S-FHSS mode cannot use telemetry.
- FASSTest 12CH mode. Applicable with receiver voltage display.
- Telemetry sensors sold separately can be mounted in the aircraft to display a variety of information. (Receiver voltage does not require a sensor.)
- The telemetry function cannot be used if the telemetry mode of the parameters is not ACT.
- T-FHSS: When 2 receivers are used with 1 transmitter, the telemetry function cannot be used.
- If the transmitter and receiver are linked, but the receiver's ID is not recorded in the transmitter's memory, the telemetry function cannot be used.
- Turning OFF the receiver after use will cause the telemetry data just prior to this to be displayed. (Even when the receiver's power is turned OFF, the receiver voltage is not 0.0V.)

Viewing the telemetry data

Receiver → Transmitter. The reception of the signal from the receiver to the transmitter is shown. This does not affect flight.

Receiver voltage and Ext voltage display

⚠️ CAUTION

- Do not stare at or set the transmitter setting screen while flying.
  - Losing sight of the aircraft during flight is very dangerous.
  - When you want to check the information during flight, call the telemetry screen before flight and have the screen checked by someone other than the operator.
HOME/EXIT is pushed

*Be aware that pressing and holding this activates the key lock

4 of telemetry data is displayed

You can choose which type of sensor to display for four displays. Tap the sensor type.

For some sensor types, you can choose the display item. Tap to select.
**Sensor**

This screen registers the telemetry sensors used with the transmitter. When only one of a certain type of sensor is used, this setting is unnecessary and the sensor can be used by simply connecting it to the S.BUS2 port of the transmitter.

When using 2 or more of the same kind of sensor, they must be registered here.

- Tap the [Sensor] button in the Linkage menu to call the setup screen shown below.

![Graphical representation of sensor settings]

**[What is a slot?]**

Servos are classified by CH, but sensors are classified in units called “slot”. There are slots from No. 1 to No. 31.

Altitude sensors, GPS sensors and other data sensor units may use multiple slots.

Using a sensor which uses two or more slots, the required number of slots is automatically assigned by setting up a start slot.

When 2 or more of the same kind of sensor are used, the sensors themselves must allocate unused slots and memorize that slot.

- As shown in the table below, an altimeter requires 3 contiguous slots and a GPS sensor requires 8 contiguous slots. The GPS (SBS-01G) start slots are 8, 16, and 24.

*Altimeter, GPS, and other sensors that display a large amount of data require multiple slots.

*Depending on the type of sensor, the slot numbers that can be allocated may be limited.

< Linkage menu >

93
Sensor : Reload

This page is set when using multiple telemetry sensors of the same type.

When using multiple sensors of the same type the sensors must be registered in the transmitter. Connect all the sensors to be used to the T18SZ as shown in the figure at the right and register them by the following procedure. The ID of each sensor is registered in the transmitter.

• Call page 3/3 from the [Sensor] menu.

Reading all the sensors to be used

1. Connect the sensor to the T18SZ as shown in the figure above.
3. Tap “Reload”.
   All the sensors are registered and can be used.

Sensor : Register

This page is set when using multiple telemetry sensors of the same type.

This function registers an additional sensor. Connect the sensor as shown in the figure at the right and register it by the following procedure. The sensor ID is registered in the transmitter.

• Call page 3/3 from the [Sensor] menu.

Additional sensor registration

1. Connect the sensor to the T18SZ as shown in the figure above.
3. The sensor is registered and can be used.

*It is not necessary to carry out multiple battery connections like a T18MZ/T14SG.

*When the number of slots needed in registration is insufficient, an error is displayed and registration cannot be performed. Disable unused slots or perform the following reload.
Sensor : Change slot

This procedure changes the slot No. of one registered sensor.

1. Connect the sensor to the T18SZ as shown in the figure above.
3. Tap “Read”.
4. A sensor details screen appears.
5. The current start slot is displayed. To change a start slot, a + – button, tap. (Cannot be set to a slot that cannot be allocated like the table of all pages.)
6. Tap to the “Write”.

**WARNING**

Do not disconnect or turn transmitter power OFF while telemetry sensor data is being saved.

Sensor save data will be lost, resulting in malfunction.

*For some transmitters (e.g., T6K), when the start slot of a sensor is changed, the sensor cannot be used.

*It is not necessary to carry out multiple battery connections like a T18MZ/T14SG.
Telemetry

This screen displays your choice of data from the receiver.

Also warnings can be activated regarding the data. For example, if the receiver voltage drops, the user can be warned by an alarm (and vibration).

Tap the [Telemetry] button in the Linkage menu to call the setup screen shown below.

Display Sensors

Default display sensors can only be used by connecting the sensors to the receiver. For display of other sensors or to use the same type of sensor in multiple cases, either register them via the "Sensor" option on the Linkage menu or allocate the sensors to empty slots to have them display on the Telemetry screen. Refer to the previous "Sensor" explanation pages for how to do this.
Telemetry: Receiver [Battery]

In this screen, the battery voltage of a receiver is displayed.

If it becomes higher or lower than the setting an alarm and/or vibration will alert you.

• Tap the [Receiver] button in the Telemetry screen to call the setup screen shown below.

Alarm set
1. Tap Alarm and choose from Buzzer, Voice, and Inhibit.
2. When not operating vibrator, it is "Vibrator" to Inhibit. Type1-3 will be chosen if it is made to operate.
3. Tap to the Limit [4.0V] item.
4. Adjust the rate by "↑" "↓" "▲" "▲▲" button.
   Initial value: 4.0V
   Adjustment range: 0.0V~100.0V
   *When the screen is tapped for one second, the rate is reset to the initial value.
5. To terminate the input and return to the original state, push the HOME/EXIT button.

*It cannot be used in FASST mode and S-FHSS mode.
*Only receiver voltage and EXT voltage can be used in FASSTest12CH mode.
*The FASSTest18CH / T-FHSS mode can use all the telemetry functions.

Displaying data from the receiver battery voltage

Alarm is chosen from Buzzer, Voice, and Inhibit.

The ON/OFF switch of Speech is chosen.

↓ The "down" arrow will indicate that an alarm will sound when the voltage drops to below the setting.

Max. and min. values since the power was turned ON will display.

Return to Linkage menu

"Vibrator" type

If the following types are selected, the transmitter will vibrate during the warning.

Type 1
Type 2
Type 3
Telemetry: Receiver [Ext. battery]

The EXT-VOLT screen will display the data from the EXT-battery output from the R7008SB receiver. In order to use this function, it is necessary to connect external voltage connector of the R7008SB receiver to a CA-RVIN-700 (FUTM5551) or SBS-01V to the battery you desire to measure the voltage of the EXT-battery.

1. Tap Alarm and choose from Buzzer, Voice, and Inhibit.
2. When not operating vibrator, it is "Vibrator" to Inhibit. Type1-3 will be chosen if it is made to operate.
3. Tap to the Limit [4.0V] item.
4. Adjust the rate by "▼▼▼" "▲ " "▲▲ " button.
   Initial value: 4.0V
   Adjustment range: 0.0V~100.0V
   *When the screen is tapped for one second, the rate is reset to the initial value.
5. To terminate the input and return to the original state, push the HOME/EXIT button.

*CA-RVIN-700 must be installed in the aircraft.

You will be alerted by an alarm or vibration if the voltage set by you is exceeded.

*It cannot be used in FASST mode and S-FHSS mode.
*Only receiver voltage and EXT voltage can be used in FASSTest12CH mode.
*The FASSTest18CH /T-FHSS mode can use all the telemetry functions.

● Tap the [Receiver] button in the Telemetry screen to call the setup screen shown below.

- Return to Linkage menu
- Max. and min. values since the power was turned ON will display.
- The "down" arrow will indicate that an alarm will sound when the voltage drops to below the setting.
- Alarm is chosen from Buzzer, Voice, and Inhibit.
- The ON/OFF switch of Speech is chosen.

Alarm set

1. Tap Alarm and choose from Buzzer, Voice, and Inhibit.
2. When not operating vibrator, it is "Vibrator" to Inhibit. Type1-3 will be chosen if it is made to operate.
3. Tap to the Limit [4.0V] item.
4. Adjust the rate by "▼▼▼" "▲ " "▲▲ " button.
   Initial value: 4.0V
   Adjustment range: 0.0V~100.0V
   *When the screen is tapped for one second, the rate is reset to the initial value.
5. To terminate the input and return to the original state, push the HOME/EXIT button.

"Vibrator" type

If the following types are selected, the transmitter will vibrate during the warning.

Type 1
Type 2
Type 3
Telemetry: Temperature

* A temperature sensor must be installed in the aircraft.

Temperature is a screen which displays/sets up the temperature information from an optional temperature sensor.

The temperature of the model (engine, motor, battery, etc.) which is flying can be displayed.

If it becomes higher or lower than the setting an alarm and/or vibration will alert you.

- Tap the [Temperature] button in the Telemetry screen to call the setup screen shown below.

Displaying data from the temperature

Alert set: Temperature warning

1. Tap Alarm and choose from Buzzer, Voice, and Inhibit.
2. When not operating vibrator, it is "Vibrator" to Inhibit. Type 1-3 will be chosen if it is made to operate.
3. Tap to the Limit [°C] item.
4. Adjust the rate by "$\downarrow\downarrow\downarrow\downarrow\downarrow$ " "$\uparrow\uparrow\uparrow\uparrow\uparrow$ " button.
   Initial value: $100^\circ$C $0^\circ$C
   Adjustment range: $-20^\circ$C $-200^\circ$C
   ($\uparrow\text{Limit} \geq \downarrow\text{Limit}$)
   * When the screen is tapped for one second, the rate is reset to the initial value.
5. To terminate the input and return to the original state, push the HOME/EXIT button.
Telemetry : RPM Sensor

The RPM Sensor screen is used to set up an optional rpm sensor and display the rotation information it transmits.

The rotation of the model (engine, motor, etc.) which is flying can be shown.

If it becomes higher or lower than the setting an alarm and/or vibration will alert you.

- Tap the [rpm sensor] button in the Telemetry screen to call the setup screen shown below.

A setup of the rpm on which the alarm operates.

Max. and min. values since the power was turned ON will display.

An upward arrow will show that an alarm will sound when the rpm rises above the set value.

A downward arrow will show that an alarm will sound when the rpm falls below the set value.

Alarm is chosen from Buzzer, Voice, and Inhibit.

The ON/OFF switch of Speech is chosen.

Alarm set : Over (Under) rotations

1. Tap Alarm and choose from Buzzer, Voice, and Inhibit.
2. When not operating vibrator, it is "Vibrator" to Inhibit. Type1-3 will be chosen if it is made to operate.
3. Tap to the Limit [xxx rpm] item.
4. Adjust the rate by "↑" "↓" "↑" "↓" "↑" "↓" "↑" "↓" button.
   Initial value: ↑ 2,000 rpm ↓ 0 rpm
   Adjustment range: 0 rpm~150,000 rpm
   (↑ limit ≥ ↓ limit)
   *When the screen is tapped for one second, the rate is reset to the initial value.
5. To terminate the input and return to the original state, push the HOME/EXIT button.

Displaying data from the rpm

* A rpm sensor must be installed in the aircraft.
* It cannot be used in FASST mode and S-FHSS mode.
* Only receiver voltage and EXT voltage can be used in FASSTest12CH mode.
* The FASSTest18CH / T-FHSS mode can use all the telemetry functions.

Alarm set : Over (Under) rotations

1. Tap Alarm and choose from Buzzer, Voice, and Inhibit.
2. When not operating vibrator, it is "Vibrator" to Inhibit. Type1-3 will be chosen if it is made to operate.
3. Tap to the Limit [xxx rpm] item.
4. Adjust the rate by "↑" "↓" "↑" "↓" "↑" "↓" "↑" "↓" button.
   Initial value: ↑ 2,000 rpm ↓ 0 rpm
   Adjustment range: 0 rpm~150,000 rpm
   (↑ limit ≥ ↓ limit)
   *When the screen is tapped for one second, the rate is reset to the initial value.
5. To terminate the input and return to the original state, push the HOME/EXIT button.

"Vibrator" type

If the following types are selected, the transmitter will vibrate during the warning.

Type 1
Type 2
Type 3
Telemetry : Altitude

An altitude sensor or GPS sensor must be installed in the aircraft.

Altitude is a screen which displays / sets up the altitude information from an optional altitude sensor or GPS sensor. The altitude of the model which is flying can be known. If it becomes higher (low) than preset altitude, you can be told by alarm. Warning by vibration can also be chosen. Data when a power supply is turned on shall be 0 m, and it displays the altitude which changed from there. Even if the altitude of an airfield is high, that shall be 0 m and the altitude difference from an airfield is displayed. This sensor calculates the altitude from atmospheric pressure. Atmospheric pressure will get lower as you go up in altitude. Using this, the sensor will estimate the altitude. Please understand that an exact advanced display cannot be performed if atmospheric pressure changes in a weather situation.

*It cannot be used in FASST mode and S-FHSS mode.
*Only receiver voltage and EXT voltage can be used in FASSTTest12CH mode.
*The FASSTTest18CH / T-FHSS mode can use all the telemetry functions.

● Tap the [Altitude] button in the Telemetry screen to call the setup screen shown below.

Displaying data from the altitude

First, the set of a reference is required.

1. The model and transmitter to which the altitude sensor was connected are turned on.
2. Tap to the [Preset] of “Reference” item.
   *Atmospheric pressure is changed according to the weather also at the same airfield. You should preset before a flight.

"Vibrator" type
If the following types are selected, the transmitter will vibrate during the warning.

<table>
<thead>
<tr>
<th>Type</th>
<th>&quot;Vibrator&quot; Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>![Type 1]</td>
</tr>
<tr>
<td>2</td>
<td>![Type 2]</td>
</tr>
<tr>
<td>3</td>
<td>![Type 3]</td>

</tbody>
</table>

Alarm set : Altitude

1. Tap Alarm and choose from Buzzer, Voice, and Inhibit.
2. When not operating vibrator, it is "Vibrator" to Inhibit. Type 1-3 will be chosen if it is made to operate.
3. Tap to the Limit [xxx m] item.
4. Adjust the rate by "▼▼" "▲▲" "▲▲" "▲▲" button.
   Initial value: ±200m ±50m
   Adjustment range -500m~+3,000m
   (±Limit ±Limit)
   *When the screen is tapped for one second, the rate is reset to the initial value.
5. To terminate the input and return to the original state, push the HOME/EXIT button.

Max. and min. values since the power was turned ON will display.

↑ An upward arrow indicates the alarm will sound when the altitude reaches above your set value.

↓ A downward arrow indicates the alarm will sound when the altitude reaches below your set value.

Alarm is chosen from Buzzer, Voice, and Inhibit.
The ON/OFF switch of Speech is chosen.

The ON/OFF switch of melody is chosen.

If this is set to Mode 1-4, a rise and dive are told by a different melody.

- Mode 1: Little rise/dive → Melody changes : sensitively
- Mode 4: Big rise/dive → Melody changes : insensible

Return to Linkage menu
Telemetry : Altitude [Variometer]

VARIO is a screen which displays / sets up the variometer information from an optional altitude sensor or GPS sensor.

The variometer of the model which is flying can be known.

If it becomes higher or lower than the setting an alarm and/or vibration will alert you.

To ensure that the pilot is aware as to the model's status, the T18SZ incorporates a different melody for ascent and descent. Additionally, depending upon the rate of climb or descent, the tones vary to indicate whether or not the airplane is climbing or descending at a rapid rate.

- It cannot be used in FASST mode and S-FHSS mode.
- Only receiver voltage and EXT voltage can be used in FASSTeR12CH mode.
- The FASSTeR18CH / T-FHSS mode can use all the telemetry functions.

- Tap the [Variometer] button in the Telemetry screen to call the setup screen shown below.

First, the set of a reference is required.
1. The model and transmitter to which the altitude sensor was connected are turned on.
2. Tap to the [Preset] of "Reference" item.

* Atmospheric pressure is changed according to the weather also at the same airfield. You should preset before a flight.

"Vibrator" type
If the following types are selected, the transmitter will vibrate during the warning.

<table>
<thead>
<tr>

</tbody>
</table>

Alert set : variometer
1. Tap Alarm and choose from Buzzer, Voice, and Inhibit.
2. When not operating vibrator, it is "Vibrator" to inhibit. Type 1-3 will be chosen if it is made to operate.
3. Tap to the Limit [m/s] item.
4. Adjust the rate by "▲" "▲" "▲" "▲" button.
   Initial value: +1m
   Adjustment range: -50m/s~+50m/s
   *When the screen is tapped for one second, the rate is reset to the initial value.
5. To terminate the input and return to the original state, push the HOME/EXIT button.

Displaying data from the variometer

Max. and min. values since the power was turned ON will display.

An upward arrow indicates the alarm will sound when the variometer reaches above your set value.

A downward arrow indicates the alarm will sound when the variometer reaches below your set value.

Alarm is chosen from Buzzer, Voice, and Inhibit.

The ON/OFF switch of Speech is chosen.

The ON/OFF switch of melody is chosen.

If this is set to Mode1-4, a rise and dive are told by a different melody.

Mode 1 : Little rise/dive → Melody changes : sensitively
Mode 4 : Big rise/dive → Melody changes : insensible

Return to Linkage menu
Telemetry: Voltage [Battery]

In this screen, the battery voltage is displayed. In order to use this function, it is necessary to connect External voltage connector of R7008SB ↔ SBS-01V ↔ Battery

SBS-01V measures two batteries. The power battery connected to two lines is displayed on EXT-VOLT. The battery for receivers connected to 3P lines is displayed here.

- Tap the [Voltage] button in the Telemetry screen to call the setup screen shown below.

Max. and min. values since the power was turned ON will display.

↓ The "down" arrow will indicate that an alarm will sound when the voltage drops to below the setting.

Alarm is chosen from Buzzer, Voice, and Inhibit.

The ON/OFF switch of Speech is chosen.

Alarm set

1. Tap Alarm and choose from Buzzer, Voice, and Inhibit.
2. When not operating vibrator, it is "Vibrator" to Inhibit. Type1-3 will be chosen if it is made to operate.
3. Tap to the Limit [4.0V] item.
4. Adjust the rate by "▼▼" "▼" "▲" "▲▲" button.
   Initial value: 4.0V
   Adjustment range: 0.0V~100.0V
   *When the screen is tapped for one second, the rate is reset to the initial value.
5. To terminate the input and return to the original state, push the HOME/EXIT button.

*Refer to the manual of SBS-01V for the details of wiring.

Displaying data from the receiver battery voltage

*SBS-01V must be installed in the aircraft.
In this screen, the battery voltage of a receiver is displayed.

If it becomes higher or lower than the setting an alarm and/or vibration will alert you.

*It cannot be used in FASST mode and S-FHSS mode.
*Only receiver voltage and EXT voltage can be used in FASSTest12CH mode.
*The FASSTest18CH / T-FHSS mode can use all the telemetry functions.

Two example of wiring are shown

Two drive batteries are measured (R7008SB use)

Two drive batteries and power supplies for servos are measured (R7008SB use)

Linkage menu
Telemetry: Voltage [Ext. battery]

In this screen, the EXT battery voltage is displayed. In order to use this function, it is necessary to connect External voltage connector of R7008SB ⇔ SBS-01V ⇔ Battery

SBS-01V measures two batteries. The power battery connected to two lines is displayed on EXT-VOLT.

* SBS-01V must be installed in the aircraft.
* It cannot be used in FASST mode and S-FHSS mode.
* Only receiver voltage and EXT voltage can be used in FASSTest12CH mode.
* The FASSTest18CH /T-FHSS mode can use all the telemetry functions.

1. Tap the [Voltage] button in the Telemetry screen to call the setup screen shown below.

2. When not operating vibrator, it is "Vibrator" to Inhibit. Type1-3 will be chosen if it is made to operate.

3. Tap Limit [4.0V].

4. Adjust the rate by "▼▼" "▲▲" "▲" " ▲ ▲ " button.
   Initial value: 4.0V
   Adjustment range: 0.0V~100.0V
   *When the screen is tapped for one second, the rate is reset to the initial value.

5. To terminate the input and return to the original state, push the HOME/EXIT button.
Telemetry : GPS [Distance]

The Distance screen displays and sets altitude data from an SBS-01G GPS Sensor (sold separately), and allows the distance to the airborne aircraft to be read by the transmitter. When the aircraft flies inside or outside the set distance an alarm and vibration alerts the pilot.

- Tap the [GPS] button in the Telemetry screen to call the setup screen shown below.

*Displaying data from the Distance Screen

*A GPS sensor must be installed in the aircraft.

*The GPS sensor is necessary, and is sold separately. Mount and connect the sensor in accordance with the sensor instruction manual.

*It cannot be used in FASST mode and S-FHSS mode.

*Only receiver voltage and EXT voltage can be used in FASSTest12CH mode.

*The FASSTest18CH /T-FHSS mode can use all the telemetry functions.

![Distance Screen Diagram]

- Return to Linkage menu
- Max. and min. values since the power was turned ON will display.
- ↑ An upward arrow indicates the alarm will sound when the distance reaches above your set value.
- ↓ A downward arrow indicates the alarm will sound when the distance reaches below your set value.
- Alarm is chosen from Buzzer, Voice, and Inhibit.
- The ON/OFF switch of Speech is chosen.
- Tap to the [Preset] of "Reference" item. Sets the current aircraft position as the starting point.

"Vibrator" type
If the following types are selected, the transmitter will vibrate during the warning.

- Type 1
- Type 2
- Type 3

Altitude calculated as either straight line distance (slant) or surface distance on a map can also be selected.

Select <Slant> <Surface> to "Distance mode", tap the screen.
First, the set of a reference is required.
1. The model and transmitter to which the GPS sensor was connected are turned on.
2. Tap to the [Preset] of “Reference” item.

*Now, the position of the present model was set to 0 m.

Setting a "too far" alarm distance
1. Tap Alarm and choose from Buzzer, Voice, and Inhibit.
2. When not operating vibrator, it is "Vibrator" to Inhibit. Type1-3 will be chosen if it is made to operate.
3. Tap Limit [m].
4. Adjust the rate by "↑↑" "↑" "↑↑↑" button.
   Initial value: 1,000m
   Adjustment range 0m~3,000m
   (↑Limit ≥ ↓Limit)
*When the screen is tapped for one second, the rate is reset to the initial value.
5. To terminate the input and return to the original state, push the HOME/EXIT button.

Setting a "too close" alarm distance
1. Tap Alarm and choose from Buzzer, Voice, and Inhibit.
2. When not operating vibrator, it is "Vibrator" to Inhibit. Type1-3 will be chosen if it is made to operate.
3. Tap Limit [m].
4. Adjust the rate by "↓↓" "↓" "↑" "↑↑" button.
   Initial value: 0m
   Adjustment range 0m~3,000m
   (↑Limit ≥ ↓Limit)
*When the screen is tapped for one second, the rate is reset to the initial value.
5. To terminate the input and return to the original state, push the HOME/EXIT button.

*Positioning time of GPS
When powered up, the SBS-01G begins to acquire GPS satellite data. This process can take several minutes. Please do not move the model during this process. During acquisition, the LED on the SBS-01G will blink green; after the satellite's signals have been acquired, the LED will become solid green, and the GPS signal strength display on the transmitter will show three bars.

Moving the model before the satellites are fully acquired will cause a delay in acquiring the satellite signal.
Telemetry : GPS [Speed]

The speed screen displays and sets the speed data from an SBS-01G (GPS sensor) sold separately.

The speed of the aircraft during flight can be displayed. After flight, the maximum speed during flight can be viewed. Because this speed is based on position data from a GPS satellite, the ground speed is displayed instead of air speed. Consequently, with a head wind, the displayed speed decreases and with a tail wind, the displayed speed increases.

- Tap the [GPS] button in the Telemetry screen to call the setup screen shown below.

Return to Linkage menu

Max. and min. values since the power was turned ON will display.

\[\uparrow\] An upward arrow indicates the alarm will sound when the speed reaches above your set value.

\[\downarrow\] A downward arrow indicates the alarm will sound when the speed reaches below your set value.

Alarm is chosen from Buzzer, Voice, and Inhibit.

The ON/OFF switch of Speech is chosen.

Alarm setting when speed increases

1. Tap Alarm and choose from Buzzer, Voice, and Inhibit.
2. When not operating vibrator, it is “Vibrator” to Inhibit. Type 1-3 will be chosen if it is made to operate.
3. Tap Limit [xx km/h].
4. Adjust the rate by "↓↓" "↑↑" "↑↓" "↓↑" button.
   Initial value: 200km/h 0km/h
   Adjustment range 0km/h~500km/h (↓Limit ≥ ↑Limit)
   *When the screen is tapped for one second, the rate is reset to the initial value.
5. To terminate the input and return to the original state, push the HOME/EXIT button.

Displaying data from the speed

*A GPS sensor must be installed in the aircraft.

*The GPS sensor is necessary, and is sold separately. Mount and connect the sensor in accordance with the sensor instruction manual.
*It cannot be used in FASST mode and S-FHSS mode.
*Only receiver voltage and EXT voltage can be used in FASSTest12CH mode.
*The FASSTest18CH /T-FHSS mode can use all the telemetry functions.

If the following types are selected, the transmitter will vibrate during the warning.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>

</tr>
<tr>
<td>Type 3</td>
<td><img src="image3.png" alt="Image" /></td>
</tr>
</tbody>
</table>

*Speed alarm precaution

Since the GPS speed sensor displays the ground speed, it cannot be used as a stall alarm. For example, an aircraft that stalls at 50km/h will stall if the tailwind is 5km/h or greater even through 55km/h is displayed by ground speed. In addition, with an aircraft that will disintegrate in midflight at 400km/h at an over-speed alarm, when the headwind reaches 30km/h the airplane will disintegrate in midair due to over speeding even at a ground speed of 370km/h.

< Linkage menu > 107
Telemetry : GPS [Altitude] [Variometer] [Position]

The Altitude, Variometer, Position screen displays and sets the data from an SBS-01G (GPS sensor) sold separately.

*The GPS sensor is necessary, and is sold separately. Mount and connect the sensor in accordance with the sensor instruction manual.

- Select [GPS] in the Telemetry screen and access the setup screen shown below.

*A GPS sensor must be installed in the aircraft.

*It cannot be used in FASST mode and S-FHSS mode.

*Only receiver voltage and EXT voltage can be used in FASSTest12CH mode.

*The FASSTest18CH /T-FHSS mode can use all the telemetry functions.

- Return to Linkage menu

Max. and min. values since the power was turned ON will display.

Refer to the former page for a setup about Altitude and Variometer.

This indicates the receiving accuracy from a GPS Satellite. When three bars are displayed, the GPS is ready for use.

The position of the present model is displayed.
Telemetry : Servo sensor [Current]

The SBS-01S can monitor and display the in-flight current, operating angle, and internal temperature of up to two S.BUS2 servos.

If you forget to connect the servo wiring during fuselage assembly, or the servo was disconnected, an alarm can be activated at the transmitter.

1. Select [Servo sensor] in the Telemetry screen and access the setup screen shown below.

- Return to Linkage menu

Max. and min. values since the power was turned ON will display.

When the Alarm or Vibrator options are activated, the servo connection will display.

*This alarm and display is limited to the S.BUS servos connected to the servo sensors.

- An upward arrow indicates the alarm will sound when the current reaches above your set value.

- A downward arrow indicates the alarm will sound when the current reaches below your set value.

Alarm is chosen from Buzzer, Voice, and Inhibit.

The ON/OFF switch of Speech is chosen.

Tap here and go to the Servo 2 settings page. (Display and settings content is the same as Servo 1.)

Tapping this will take you to the settings screen for the current alarm

Tapping this and selecting "Buzzer" will cause the device to sound an alarm when servos are not connected.

Tapping this and selecting "Each type" will cause the device to vibrate when servos are not connected.

A setup of the current on which the alarm operates.

Vibrator is chosen from type1-3, and Inhibit.

Initial value: ↑ 10.0A ↓ 0.0A
Adjustment range 0.0A~10.0A (↑ Limit ↓ ↓ Limit)
Telemetry : Servo sensor [Temperature] [Angle]

*Servo sensor must be installed in the aircraft.

Select [Servo sensor] in the Telemetry screen and access the setup screen shown below.

- Return to Linkage menu

- An upward arrow indicates the alarm will sound when the angle reaches above your set value.

- A downward arrow indicates the alarm will sound when the angle reaches below your set value.

- Alarm is chosen from Buzzer, Voice, and Inhibit.

- The ON/OFF switch of Speech is chosen.

- A setup of the angle on which the alarm operates.

- Initial value: ↑ +180.0° ↓ -180.0°
  Adjustment range -180.0° ~ +180.0°
  (↑ Limit ≥ ↓ Limit)
Telemetry: Current [Current] [Voltage] [Capacity]

The SBS-01C has the capability of measuring current, voltage and capacity (consumption) from drive battery at the same time.

*Current sensor must be installed in the aircraft.

- Select [Current] in the Telemetry screen and access the setup screen shown below.

Max. and min. values since the power was turned ON will display.

↑ An upward arrow indicates the alarm will sound when the current reaches above your set value.

↓ A downward arrow indicates the alarm will sound when the current reaches below your set value.

Alarm is chosen from Buzzer, Voice, and Inhibit.

The ON/OFF switch of Speech is chosen.

Tapping this will take you to the settings screen for the current alarm

A setup of the current on which the alarm operates.

"Vibrator" type

If the following types are selected, the transmitter will vibrate during the warning.

Type 1
Type 2
Type 3

*Refer to the manual of SBS-01C for the details of wiring.

< Linkage menu > 111
Telemetry data log function

Telemetry data has been adapted to the log function which is recorded at the SD card.

**Setting method**
1. Open the linkage menu Tele. setting screen.
2. Log recording can be started and stopped by operating a switch. The Logging switch is selected.
3. The log output interval can be set.

* The data to be recorded is updated at the time set by Linkage menu → System Type screen D/L interval. For example, when the log output interval is 1 second and the D/L interval is 2 seconds the same data is overlapped and recorded twice.

**Operation method**
1. Insert the SD card into the card slot.
2. Set the switch set by Log Start/Stop Switch to ON. A beep sounds and a log file is created and recording of the telemetry data begins.

Absolutely never remove the SD card while log data is being recorded.
3. Set the switch set by Logging switch to OFF. A beeping sound is generated and recording of the telemetry data stops.
4. Turn off the transmitter power and remove the SD card.

- **Log file**
  - A log file is created in the SD card LOG folder. Two files with the same filename, but a different extension are created. (Example: 00001234.FLI, 00001234.FLD)
  - Extension FLI: Slot allocation information file
  - Extension FLD: Log data file
*When copying or moving a log file, always select both the .FLI file and .FLD file.

Log files can be converted to CSV format by using the telemetry log converter available at the Futaba website.

- **Notes**
  - Altimeter altitude data and GPS distance and altitude data output with the point that time logging started as the reference (0m). When the transmitter preset position and the log start position are different, the transmitter display and the log data display will also be different. The altitude and distance from the take-off position can be recorded by starting logging immediately after take-off.
  - The transmitter gear ratio or number of fins setting is not reflected in the speedometer log data (speed). Multiply the gear ratio or number of fins by the speed data.
  - When the SD card becomes full, recording stops and does not resume even if logging is restarted.
T18SZ trainer system makes it possible for the instructor to choose which channels and operation modes can be used in the student's transmitter. The function and rate of each channel can be set. The training method can also be matched to the student's skill level. Two transmitters must be connected by an optional Trainer Cord, and the Instructor's transmitter should be programmed for trainer operation, as described below.

When the Instructor activates the trainer switch, the student has control of the aircraft (if MIX/FUNC/NORM mode is turned on, the Instructor can make corrections while the student has control). When the switch is released the Instructor regains control. This is very useful if the student gets the aircraft into an undesirable situation.

- Setting data are stored to model data.
- Student rate can be adjusted at MIX/FUNC/NORM mode.
- Activated student channels can be selected by switches.

**Note:** This trainer system can be used in the following manner:
1. With the T18SZ transmitter and a conventional transmitter, if the channel order is different, it is necessary to match the channel order before using this function.

You can select the channel of input data from student's transmitter in the "FUNC" or "MIX" mode.

2. When the T18SZ is used as the instructor’s transmitter, set the modulation mode of the student’s transmitter to PPM.

If being used as the student, T18SZ can be connected to the instructor’s transmitter which requires the student's mode to be PPM. T18SZ always sends PPM mode signal from the trainer jack.

( In the case of student's transmitters other than 2.4 GHz)

3. Be sure that all channels work correctly in both transmitters before flying.

### Corresponding types of transmitters and trainer mode settings:

</tbody>
</table>
When using at the student side

1. Select the mode.
   * When changing the mode, tap to the item you want to change and change the mode by "▼▼" "▼" "▲" "▲▲" button. The display blinks. Tap the screen to change the mode.
   "Teacher/Student": Select [Student].
   "ACT/INH": Enable operation by changing to [ACT].
   "16/12/8 CH": When the student uses the T18SZ, T14SG, T18MZ, select [16CH]. When the student uses the T14MZ, T12Z, T12FG or FX-40, select [12CH]. Otherwise select [8CH].

2. Select the trainer switch.
   * When setting or changing the switch, tap to the "SWITCH" item, call the switch setup screen and set the desired switch and ON/OFF direction.

   (See "Switch selection method" at the end of this manual for selection method details.)

   *The switch mode can also be selected when setting the ON position on the switch setup screen. When [Normal] is selected, normal ON/OFF operation is performed. When [Alternate] is selected, the trainer function is alternately turned on and off each time the switch is operated. This allows alternate ON/OFF switching even when a momentary switch (SH) is used.

   Note: The trainer function won’t be turned on unless the instructor’s transmitter receives signals from the student’s transmitter. Be sure to confirm this after connecting your trainer cable.

When using at the teacher side

1. Select the mode.
   * When changing the mode, tap to the item you want to change and change the mode by "▼▼" "▼" "▲" "▲▲" button. The display blinks. Tap the screen to change the mode.
   "Teacher/Student": Select [Teacher].
   "ACT/INH": Enable operation by changing to [OFF] or [ON].
   "16/12/8 CHANNEL": When the student uses the T18SZ (including the T18MZ, T14SG) select [16CH]. Otherwise select [12CH] or [8CH].

2. Select the trainer switch.
   * When setting or changing the switch, tap to the "SWITCH" item, call the switch setup screen and set the desired switch and ON/OFF direction.

   (See "Switch selection method" at the end of this manual for selection method details.)

   *The switch mode can also be selected when setting the ON position on the switch setup screen. When [Normal] is selected, normal ON/OFF operation is performed. When [Alternate] is selected, the trainer function is alternately turned on and off each time the switch is operated. This allows alternate ON/OFF switching even when a momentary switch (SH) is used.

   Note: The trainer function won’t be turned on unless the instructor’s transmitter receives signals from the student’s transmitter. Be sure to confirm this after connecting your trainer cable.
3. Select the operating mode for each channel.

"NORM": The model is controlled by signals from the student transmitter.

"MIX" mode: The model is controlled by signals from the teacher and student transmitters. (Reset the student's model data to the default condition.)

"FUNC" mode (function mode):
The model is controlled by signals from the student transmitter with the teacher AFR setting. (Reset the student's model data to the default condition.)

"OFF": Only the teacher side operates.

*The setting above allows setting of the servo throw relative to the amount of student side operation when [MIX] or [FUNC] was selected.

When changing the rate, use the "▲▲" "▲" "▲▲" button to Tap the [Rate] item of the channel.

Setting range: -100--+100
Initial value: +100

*When the value is tapped, the rate is reset to the initial value.

4. Set the switch of each channel.

*When setting the switch at each channel, tap to the "SW" item of the channel you want to change, call the switch setup screen, and select the switch.

"--": Always ON.

"SA"~"SH": The switch which enables student side operation can be selected. (See "Switch selection method" at the end of this manual for selection method details.)

---

**Trainer student channel setting function**

In training mode, the instructor's transmitter can pick up the student's signal on both the "Function" and "Mix" channels. That makes it easy for the two transmitters to connect even if the student and instructor have set up their transmitters differently.

*When the instructor's transmitter mode is set to "NORM", the signal of the same channel of the student's transmitter is output as is. (The same as before.)
The warning display at power ON can be turned ON/OFF for each function. Use by setting functions which may be dangerous if operated at power ON to ON. Initial setting is all ON (Buzzer).

- Tap the [Warning setting] button in the Linkage menu to call the setup screen shown below.

- Return to Linkage menu

The settings can be changed individually. When set to [Inhibit], a warning is not displayed at power ON.

"Vibrator" type
If the following types are selected, the transmitter will vibrate during the warning.

Type 1
Type 2
Type 3

WARNING

It is extremely dangerous to unnecessarily inhibit essential warnings.

- Careless spinning of propellers or rotors poses a danger of serious injury or death.
User menu setting

T18SZ has a menu for each of the following: System, Linkage, and Model. Also, you can create a personalized User menu that can include all of the menus that you use most often.

- Tap the [User menu setting] button in the Linkage menu to call the setup screen shown below.
- Return to Linkage menu

Once pressed, 3 pages of choices will be displayed.

Make your selection, press your choice and the first of your "User menu" will be entered.

How to call a User menu

1. From the home screen, press the U.MENU/MON. button.

*Any change made to data entered from the User menu or from the normal method of use are the same. Changes made in either way are saved into the transmitter memory.
Data reset

This function is designed to allow you to reset selected portions or all of the settings saved in the active model memory. You may individually choose to reset the following sets of data:

**T1~T6 (All condition):**
Reset the digital trim setting.
- All the conditions, or the condition currently being displayed (the entire group for group setting), can be selected.
- The trim step amount and trim rate are not reset.

**T1~T6 (Current and Group condition):**
Reset the digital trim setting.
- Current condition, group condition, can be selected.
- The trim step amount and trim rate are not reset.

- Select [Data reset] at the linkage menu and call the setup screen shown below.

![Data reset setup screen]

- Return to Linkage menu

**Data resetting method**

1. Tap to the item you want to reset and tap the screen.
- A confirmation message appears.

2. Execute reset by tapping the "Yes".

[T1-T6 (All condition)]: Resets only the T1-T6 (all conditions)
[T1-T6 (Current and Group condition)]: Resets only the data of T1-T6 (condition in use and all the conditions set to group mode)
[Model menu setting]: Resets all the functions in the model menu, except the condition selection functions.
[All model setting]: Resets all the functions in the linkage menu and model menu except the frequency, model select, and model type functions.
[Function name]: Resets only the function name functions.
[Telemetry]: Resets only the telemetry functions.

**CAUTION**

Never engage the Data reset function while the engine is starting or the motor drive wiring is connected.

- Sudden, abrupt spinning of propellers or rotors is extremely dangerous.

**Throttle Reverse**

- Only the throttle channel (CH3) initial setting is REV (reverse). Thoroughly check the Hi and Low directions of the engine or motor used and be careful that they do not suddenly run at full speed. Even after data reset, CH3 is reversed.
This section describes the AFR, program mixing, and other functions common to all model types.

Before setting the model data, use the Model Type function of the Linkage menu to select the model type matched to the fuselage. When another model type is selected thereafter, the AFR, program mixing, and other setting data are reset.

The functions in the Model menu can be set for each flight condition. When you want to use the system by switching the settings for each condition by switch, stick position, etc., use the Condition Select function to add flight conditions. (Up to 8 conditions can be used)

Note: The T18SZ is designed so that the airplane and glider model types are compatible with aircraft of similar type wings.

This section outlines the relationship between the functions common to airplanes and gliders, except some dedicated functions, and model type. The setting items depend on the number of servos and other differences according to the wing type used, but reread them. The setup screens in the instruction manual are typical examples.

---

Model menu (Common functions) functions table

- [Servo monitor]: Displays the servo test and operation position—Linkage menu referring
- [Condition select]: Flight conditions addition, deletion, copy, condition renaming, and condition delay can be set.
- [AFR]: Sets the angle and curve of all the operation functions.
- [Dual rate]: D/R curve which can be switched with a switch, etc. can also be added.
- [Prog. mixes]: Program mixing which can be freely customized. Up to 10 mixes can be used for each condition.
Condition select

Flight condition's addition, deletion, copy, condition renaming, and condition delay can be set. [All model types]

The functions in the Model menu can be used by switching the settings of up to 8 flight conditions by using the Condition select function to add flight conditions. Add conditions, as required.

When you do not want to use the Condition select function, this setting is unnecessary. In this case, use the flight conditions assigned at initial setting.

- Since switching by stick and lever position, in addition to ordinary toggle switch, is possible as the flight condition selector switch, this function can be linked with other operations.
- A Condition Delay function can be set. Unnecessary fuselage motion generated when there are sudden changes in the servo positions and when there are variations in the operating time between channels during condition switching can be suppressed. The delay can be set for each channel.
- When setting the delay function at the switching destination condition, the related function changes after a delay corresponding to the set amount.

Select [Condition select] at the model menu and call the setup screen shown below.

**Condition Renaming**

1. Select the condition by tapping the condition you want to rename in Conditions List.
2. Tap the [Rename] button.
3. Enter the new name from the keyboard which appears on the screen.
4. When the keyboard [Condition name] key is tapped, the new name is registered.

**Condition Addition**

1. When the [Add] button is tapped, the Condition Select screen appears.
   *Only the number of buttons corresponding to the conditions which can be added are displayed.
2. Select the desired conditions by tapping the buttons.
   *The selected conditions are added to Conditions List.
3. Tap the [+] button to call the <Switch> screen.
4. Select the switch to be used in condition switching.
   (See "Switch selection method" at the end of this manual for selection method details.)
5. The "Condition1" data for the added conditions is copied.

1. Select the condition by tapping the condition you want to rename in Conditions List.
2. Tap the [Rename] button.
3. Enter the new name from the keyboard which appears on the screen.
4. When the keyboard [Condition name] key is tapped, the new name is registered.
1. Tap the [Copy] button. The Copy screen appears.
2. Select the condition by tapping the button of the copy source conditions.
3. Next, select the condition by tapping the copy destination condition.
4. Tap the [Copy] button.
5. When the [Yes] button is tapped, the data is copied. (To abort copying, tap the [No] button.)

Condition Remove

1. Select the condition by tapping the condition you want to reset in Conditions List.
2. Tap the [Remove] button.
3. When the [Yes] button is tapped, the condition is reset. (To abort resetting, tap the [No] button.)

Group/single mode switching (Gr./Sngl)
(For a description of the operation method, see the description at the back of this manual.)

Priority change

1. Tap the condition whose priority you want to change in Conditions List.
2. Change the priority with the priority [△] or [▽] button. (The last condition has the highest priority.)

*The initial setting condition cannot be moved. It has the lowest priority.

Condition delay setting

1. Switch to the condition you want to set.
2. Tap the Delay button of the channel you want to set.
3. Use the value input buttons to set the delay.
   - Initial value: 0
   - Adjustment range: 0~27 (maximum delay)
AFR function is used to adjust the throw and operation curve of the stick, lever, and switch functions for each flight condition. This is normally used after End Point has defined the maximum throw. When mixing is applied from one channel to another channel, both channels can be adjusted at the same time by adjusting the operation rate through the AFR function.

- Select [AFR] at the model menu and call the setup screen shown below.

When D/R is turned ON, the display will show "D/R----", and the rudder angle (rate) and EXP can be set when D/R is ON.

- Return to Model menu

Function selection
1. When the function select button is tapped, a selection screen appears.
2. Select the function you want to set at the selection screen.

- Group/single mode switch (Gr./Sngl) (For more information, see the description at the back of this manual.)

- Servo speed setting (For a description of the setting method, see the description at the back of this manual.)

Operation curve adjustment: Three types of curves (EXP1, EXP2, and Point) can be selected. A maximum 17 points curve can be used for the point curve type. (Initial setting: 9 points) The number of points can also be increased and decreased and curves from complex curves to simple curves can be used.

Operation speed adjustment: The operation speed of each function when the function is operated (including at flight condition switching) can be adjusted. The function operates smoothly at a constant speed corresponding to the set speed.
Dual rate

D/R curves which can be switched by switch, etc. can be added. The curve can be adjusted by the AFR function.
- Up to 6 rates can be added for each condition.
- D/R is set for each condition and is not reflected at other conditions.
- D/R at the top of the D/R list has priority.

- Select [Dual rate] at the model menu and call the setup screen shown below.

<table>

</table>

- Return to Model menu

The ON/OFF switch of dual rate is chosen.

Activate the D/R function by tapping the [INH].

When the function select button is tapped, a selection screen appears. Select the function you want to set at the selection screen.

Rate, EXP settings are on AFR function

- Setting rudder angle, EXP
  On this D/R screen you can set functions and switchover switches. Rudder angle (rate) and EXP settings are performed on the AFR screen when the D/R switch is ON.
Program mixes

Programmable mixing may be used to correct undesired tendencies of the aircraft, and it may also be used for unusual control configurations. Mixing means that the motion of a command channel, called the "master," is added to the motion of the mixed channel, called "slave."

You may choose to have the Masters trim added to the Slave channel response, if you desire ("Trim" setting). The mixing curve can be changed so that the undesired tendencies can be corrected effectively by setting the EXP1/EXP2/Point modes.

Offset-type mixing applies a fixed offset or preset to the programmed channel servo operation and may control up to four circuits simultaneously.

The Programmable mixing includes a powerful link function, which allows Programmable mixing to be linked with the special mixing functions, or with other programmable mixing functions. The link function can be set up for Master and Slave channel individually.

- Tap the [Prog. mixes] button in the Model menu to call the setup screen shown below.

1. Tap the [Prog. mixes] button in the Model menu to call the setup screen shown below.
2. Return to Model menu

</table>

After this function is activated, the master and slave function names (or offset mixing) are displayed.

- Group/single mode switch (Gr./Sngl) (For more information, see the description at the back of this manual.)

- Operation curve setting (For a description of the setting method, see the description at the back of this manual.)

Activate the function by tapping the [INH].

The ON/OFF switch of prog. mixes is chosen.

Master function (or Stick, Switch, Dial) is chosen.

Slave function is chosen.

Servo speed setting

The on time (start/stop time) can be set up to 4 seconds. It is useful for landing gear control of the jet or scale plane, etc.

< Model menu (Common Functions) >
Setting methods

- **Group/single mode selection**
  Activating functions for only the selected conditions:
  1. Tap the [Gr] button and switch to the [Sngl] mode.
  *Each time the button is tapped, it toggles between the Gr and Sngl modes.

- **Mixing mode selection**
  Using the offset mode:
  1. Tap the Mode button and switch to the Offset mode.
  *Each time the button is tapped, it toggles between the Mixing and Offset modes.

- **Mixing setup screen selection**
  1. Tap the button of the mixing you want to set. The mixing setup screen is displayed.
  2. Activate the function by tapping the [INH] button.
  *Each time this button is tapped, it toggles between [INH] and [ON/OFF].

- **Mixing ON/OFF switch setting and ON/OFF direction switching**

  *An ON/OFF switch is not set even when the function is activated.

  1. When you want to turn mixing ON/OFF by switch, tap the [-] button to call the <Switch> screen and then select the switch and its ON direction.
  *For a description of the selection method, see [Switch setting method] at the back of this manual.

- **Master channel setting (except offset type mixing)**
  1. Tap the Master button to call the Function menu and select the master channel.
  2. To link this mixing with other mixing, tap the "Link" button.
  *Each time the button is tapped, it toggles between mixing direction + and - and "OFF" (no link).
  *Master channel control can be set to stick, VR, and other simple travels which do not include End point, AFR, D/R, mixing setting, etc. In this case, display the <Function,H/W> screen by tapping the [Stick, Switch, Dial] button and then select master channel side control.

- **Slave channel setting**
  1. Tap the Slave button to call the Function menu and select the slave channel.
  2. To link this mixing with other mixing, tap the "Link" button.
  *Each time the button is pressed, it toggles between mixing direction + and - and "OFF" (no link).

- **Trim mode ON/OFF setting**
  1. To turn the trim mode ON/OFF, tap the Trim button on the screen.
  *When mixing includes master side trim, set the Trim button to [ON]. When mixing does not include master side trim, set the Trim button to [OFF].
  *Each time this button is pressed, it toggles between [ON] and [OFF].
  *This is effective when the master channel is set by Function.

- **Mixing curve type selection**
  1. Tap the curve type selection button of the curve type you want to use to display the selection screen. Then, select the curve you want to use.
  *For a description of the curve setting method, see the description at the back of this manual.

- **Fine tuning trim setting**
  1. When using the curve fine tuning function, tap the [-] button of the Fine Tuning item to call the <Switch> screen and then select the lever, VR, etc. you want to use.
  *For a description of the fine tuning trim setting method, see the description at the back of this manual.

- **Servo speed setting**
  1. When setting the servo speed, tap the speed button. The Servo speed setup screen is displayed.
  *For a description of the servo speed setting method, see the description at the back of this manual.
  *Offset mixing changes the speed. Use the Speed In and Speed Out buttons to readjust the speed.
  The mixing switch can set a delay with a different rate at starting and stopping.
  *This function is inactive when a mixing switch is not set.
The dedicated mixes, etc. usable when airplane or glider model type is selected are displayed in this Model menu functions section. First use the Model type function of the Linkage menu to preset the model type, wing type, and tail type matched to the fuselage used. Other settings reset the data used in mixing function, etc.

These dedicated mixes can be set for each flight condition, as required. When you want to use the system by switching the settings for each condition by switch or stick position, use the Condition select function to add flight conditions. (Up to 8 conditions can be used)

Note: The T18SZ is designed so that the airplane and glider model types can handle aircraft of the same wing type. The functions common to airplanes and gliders, except some dedicated functions, are summarized without regard to the model type. The setting items are different, depending on the number of servos, etc. according to the wing type used. The setup screens in the instruction manual are typical examples.

Model menu (Airplane/Glider/Multicopter) functions table

Aileron differential
This function adjusts the left and right ailerons. Roll axis correction and fine tuning with a VR are also possible. This is convenient when making settings during flight.
[Airplane/glider, 2 ailerons or more]

Flap setting
The flaps can be adjusted independently. For a 4 flaps model, the camber flaps can be mixed with the brake flaps. [Airplane/glider, 2 flaps or more]

AIL → Camber flap
This mix operates the camber flaps in the aileron mode. It improves the operation characteristic of the roll axis. [Airplane/glider, 2 ailerons + 2 flaps or more]

AIL → Brake flap
This mix operates the brake flaps in the aileron mode. It improves the operation characteristic of the roll axis. [Airplane/glider, 4 flaps or more]

Aileron → Rudder
This mix is used when you want to operate the rudder at aileron operation. Banking at a shallow bank angle is possible. [Airplane/glider, general]

Elevator → Camber
This mix is used when you want to the mix camber flaps with elevator operation. Lifting force can be increased at elevators up. [Airplane/glider, 2 ailerons or more]
Camber mixing
This mix adjusts the camber and corrects the elevators. [Airplane/glider, 2 ailerons or more]

Airbrake→ELE
This mix is used to correct operation of the airbrakes (spoilers) when landing. [Airplane/glider, general]

Camber flap→ELE
This mix is used to correct for attitude changes when the camber flaps are being used. [Airplane/glider, 2 ailerons + 1 flap or more]

Rudder→Aileron
This function is used to correct roll knife edge, etc. of stunt planes. [Airplane/glider, general]

Rudder→Elevator
This function is used to correct roll maneuvers, knife edge, etc. of stunt planes. [Airplane, general]

Butterfly (Crow)
This function is used when powerful brake operation is necessary. [Glider, 2 ailerons or more]

Trim mix 1/2
The ailerons, elevators, and flaps trim offset rate can be called by switch or condition selection. [Glider general]

Snap roll
This function selects the snap roll switch and adjusts the steering angle of each rudder. Servo speed can also be adjusted. [Airplane general]

Air brake
This function is used when airbrakes are necessary when landing or when diving, etc. during flight. [Airplane, general]

Gyro
This is a dedicated mix when a GYA Series gyro is used. [Airplane/glider/multicopter, general]

Ailevator
This function adjusts the elevators and ailerons of models with elevator specifications. [Airplane/glider, elevator specifications]

Acceleration
Allows a brief “overload” in response to sudden Elevator, Elevator→Camber, and Ail→Rudder. [Glider general]

Motor
The operation speed when the motor of F5B and other EP gliders is started by switch can be set. [Airplane/glider, general]

V-Tail
This function adjusts the elevators and rudder of V-tail models. [Airplane/glider, V-tail specifications]

Winglet
This function adjusts the left and right rudders of winglet models. [Airplane/glider, winglet specifications]
Aileron differential  [Airplane/glider, 2 ailerons or more]

The left and right aileron differential can be adjusted independently. The differential rate can also be adjusted according to the flying state by setting a fine tuning VR.

- Select [Aileron differential] at the model menu and call the setup screen shown below.

- Return to Model menu

*The display screen is an example. The actual screen depends on the Model Type.

Setting method

- Tap to the aileron (AIL) 1~4(2) left (or right) setting item. Adjust the aileron angles.

- When setting the fine tuning VR, tap the "--" item and tap the screen to call the selection screen, and then select the fine tuning VR.

- The fine tuning rate can be set by curve.
Flap setting

[Corresponding model type]: Airplane/glider, 2 flaps or more

The up/down travel of each flap (camber flaps: FLP1/2, brake flaps: FLP3/4) can be adjusted independently at each servo according to the wing type.

- The operation reference point of each flap can be offset.

The camber flaps of a 4-flap model can be mixed with the brake flaps. (Brake FLP to camber FLP)
- An ON/OFF switch can be set.

- Select [Flap setting] at the model menu and call the setup screen shown below.

**Setting method**

- Tap flap (FLP) 1~4 up or down according to the wing type.
  Adjust the travel independently.
- To offset the operation reference point of each flap, tap the corresponding offset item. Use the "▼▼" "▼" "▲" "▲▲" button offset the reference point.
- When using brake FLP to camber FLP mixing,
  tap the [INH] item and tap the screen. (ON is displayed.)
  When setting a switch, tap the [--] item of the switch and tap the screen to call the selection screen. Then, select the switch and set its ON direction. (Always ON at "--" setting)
  (For a description of the switch selection method, see the description at the back of this manual.)

*The display screen is an example. The actual screen depends on the Model Type.*
AIL → Camber flap  [Corresponding model type]: Airplane/glider, 2 ailerons + 2 flaps or more

This mix operates the camber flaps (FLP1/2) in the aileron mode. When the aileron stick is manipulated, the ailerons and camber flaps perform aileron operation simultaneously and the operation characteristic of the roll axis is improved.

- The aileron left/right mixing rate of each flap servo can be fine-tuned.
- A mixing curve can be set.
- An ON/OFF switch can be set.
- Linking is possible: Link this mix to other mixes.

- Select [AIL→Camber flap] at the model menu and call the setup screen shown below.
- Return to Model menu

**Setting method**

- Tap [INH].
  (ON is displayed.)
- When setting a switch, tap the [-] item of the switch and tap the screen to call the selection screen, and then select the switch and set its ON direction. (Always ON at “...” setting)
  (For a description of the switch selection method, see the description at the back of this manual.)
- Tap the left or right item of each flap servo. Adjust the mixing rate.

*When the mixing direction is reversed by the linkage, adjustments can be made by changing the mixing rate polarity (+ or -).
- A mixing curve can be set. (1/2 page)
  (For a description of the mixing curve setting method, see the description at the back of this manual.)
- To set linking, tap the [Link] item. Set it to ON and tap the screen.
This mix operates the brake flaps (FLP3/4) in the aileron mode. When the aileron stick is manipulated, the aileron and brake flaps perform the aileron operation simultaneously and the operation characteristic of the roll axis is improved.

- The aileron left and right mixing rates can be adjusted for each flap servo.
- A mixing curve can be set.
- Mixing during flight can be turned ON/OFF by setting a switch. (Always ON at [–] setting)
- Linking can be set: Link this mix to other mixes.
- Select [AIL→ Brake flap] at the model menu and call the setup screen shown below.

*Return to Model menu*

**Setting method**

- Tap to the INH item. (ON is displayed.)
- When setting a switch, tap to the [–] item of the switch and tap the screen to call the selection screen, and then select the switch and set its ON direction. (Always ON at "–" setting)
- (For a description of the switch selection method, see the description at the back of this manual.)
- Tap the left or right button of each flap servo. Adjust the mixing rate.

*When the mixing direction is reversed by the linkage, adjustments can be made by reversing the mixing rate polarity (+ or -).

- A mixing curve can be set. (For a description of the curve setting method, see the description at the back of this manual.)
- To set linking, tap to the Link item. Set it to ON and tap the screen.

< Model menu (Airplane/Glider/Multicopter Functions) > 131
Aileron → Rudder

[Corresponding model type]: Airplane/glider, general

Use this mix when you want to mix the rudders with aileron operation.

- A mixing curve can be set.
- Mixing during flight can be turned ON/OFF by setting a switch. (Always ON at [-] setting)
- The mixing rate can be fine-tuned by setting a VR.

- Select [Aileron→ Rudder] at the model menu and call the setup screen shown below.
- Return to Model menu

[Fine tuning VR operation mode]
[LIN.] Mixing rate 0% at center of VR. When the VR is turned clockwise and counterclockwise, the mixing rate increases and decreases, respectively.
[ATL+] Mixing rate 0% at left end of VR. When the VR is turned, the mixing rate increases.
[ATL-] Mixing rate 0% at right end of VR. When the VR is turned, the mixing rate increases.
[SYM.] When the VR is turned to the left or right of the neutral position, the mixing rate increases.

Setting method

- Tap [INH].
  (ON is displayed.)
- When setting a switch, tap to the [-] item of the switch and tap the screen to call the selection screen, and then select the switch and set its ON direction. (Always ON at “-” setting)
  (For a description of the switch selection method, see the description at the back of this manual.)
- When setting a VR, tap to the Fine Tuning “-” item and tap the screen to call the selection screen, and then select the VR. The adjustment rate can be set. The VR operation mode can also be selected.
- A mixing curve can be set.
Elevator → Camber

[Corresponding model type]: Airplane/glider, 2 ailerons or more

This function is used when you want to mix the camber flaps with elevator operation. When used, the flaps are lowered by up elevator, and lift can be increased.

Note: Tailless wing elevator can be operated when this mix is activated.
- A mixing curve can be set.
- Mixing during flight can be turned ON/OFF by setting a switch. (Always ON at [-] setting)
- The mixing rate can be fine-tuned by setting a VR.

- Select [Elevator→Camber] at the model menu and call the setup screen shown below.

- Return to Model menu

Mixing curve setting
(For a description of the setting method, see the description at the back of this manual.)

Ailerons and flaps rate adjustment

Activate the function by tapping the [INH].

Condition group/single mode selection (Gr./Sngl)

The ON/OFF switch of mixing is chosen.

Setting method
- Tap [INH]. (ON is displayed.)
- When setting a switch, tap the [-] item of the switch and tap the screen to call the selection screen, and then select the switch and set its ON direction. (Always ON at "-" setting)
(For a description of the switch selection method, see the description at the back of this manual.)

- When setting a VR, tap the Fine tuning "-" item and tap the screen to call the selection screen, and then select the VR. The adjustment rate can be set.
The VR operation mode can also be selected.
- A mixing curve can be also set.
(For a description of the curve setting method, see the description at the back of this manual.)
Camber mixing

This function adjusts the rate of camber operation which operates the wing camber (ailerons, camber flaps, brake flaps) in the negative and positive directions. The aileron, flap, and elevator rates can also be adjusted independently by curve, and attitude changes caused by camber operation can be corrected.

*Initial setting assigns camber operation to side lever LS.

- Select [Camber mixing] at the model menu and call the setup screen shown below.

- The up/down side rates of the aileron, flap, and elevator servos can be adjusted by curve. When the mixing direction is reversed by the linkage, adjustments can be made by changing the mixing rate polarity (+ or -).

- Mixing during flight can be turned ON/OFF by setting a switch. (Always ON at [-] setting)

- A delay can be set for each condition. A cut switch which can turn OFF the delay function can be set.

- The speed of the aileron, flap, and elevator servos can be set. (In side/Out side)

Select [Camber mixing] at the model menu and call the setup screen shown below.

Activate the function by tapping the [INH].

Condition group/single mode selection (Gr./Sngl)

The ON/OFF switch of mixing is chosen.

Condition delay cut switch

Condition delay setting

Servo speed setting (For a description of the setting method, see the description at the back of this manual.)

Ailerons, flaps and elevators rate adjustment

*Initial setting assigns camber operation to side lever LS.

Overall adjustment by Rate A and Rate B.

134 < Model menu (Airplane/Glider/Multicopter Functions) >
**Setting method**

- Tap [INH].
  (ON is displayed.)
- When setting a switch, tap to the [--] item of the switch and tap the screen to call the selection screen, and then select the switch and set its ON direction. (Always ON at "--" setting)
  (For a description of the switch selection method, see the description at the back of this manual.)
- When setting a condition delay, tap to the [Condition delay] item.
  Set the delay.

  When setting a cut switch, tap [Cut-switch] and tap the screen to call the selection screen, and then select the switch and set its ON direction. (Always ON at [--] setting)
  (For a description of the condition delay function, see the description at the back of this manual.)

(Curve/rate setup screen)
- The curve and rate are adjusted by calling the aileron, flap, and elevator curve/rate screens.
  The rate and curve of each servo can be set by calling each screen. (For a description of the curve setting method, see the description at the back of this manual.)
  The servo speed can also be adjusted.

(Curve/rate setup screen)

< Model menu (Airplane/Glider/Multicopter Functions) > 135
**Airbrake → ELE**

This mix is used when you want to mix the elevators with airbrake (spoiler) operation. It raises the elevators to correct for dropping of the nose during airbrake operation.

*This function does not operate when airbrake is not assigned at the Function menu in the Linkage menu.

- The Rate 1 side/Rate 2 side mixing rate with the elevator servos can be adjusted.
- A mixing curve can be set.
- Mixing during flight can be turned ON/OFF by setting a switch. (Always ON at [--] setting)
- The mixing rate can be fine-tuned by setting a VR.

- Select [Airbrake→ ELE] at the model menu and call the setup screen shown below.

- Return to Model menu

*The display screen is an example. The actual screen depends on the model type.

**Setting method**

- Tap [INH].
  
  (ON is displayed.)

- When setting a switch, tap the [--] item of the switch and tap the screen to call the selection screen, and then select the switch and set its ON direction. (Always ON at "--" setting)

  (For a description of the switch selection method, see the description at the back of this manual.)

- When setting a VR, tap the Fine tuning "--" item and tap the screen to call the selection screen, and then select the VR. The adjustment rate can be set. The VR operation mode can also be set.

  (For a description of the fine tuning VR setting method, see the description at the back of this manual.)

- A mixing curve can be set.

  (For a description of the curve setting method, see the description at the back of this manual.)
This mixing is used to correct changes (elevator direction) generated when the camber flaps (speed flaps) are used.

- The elevator servos up side/down side rate can be adjusted. When the mixing direction is reversed by the linkage, adjustments can be made by changing the mixing rate polarity (+ or –).
- A mixing curve can be set.
- Mixing during flight can be turned ON/OFF by setting a switch. (Always ON at [-] setting)
- The mixing rate can be fine-tuned by setting a VR.

Select [Camber flap→ELE] at the model menu and call the setup screen shown below.

Return to Model menu

**Setting method**

- Tap [INH].
  (ON is displayed.)
- When setting a switch, tap to the [-] item of the switch and tap the screen to call the selection screen. Then, select the switch and set its ON direction. (Always ON at "--" setting)
  (For a description of the switch selection method, see the description at the back of this manual.)
- Tap elevator servos. Adjust the mixing rate.

*When the mixing direction is reversed by the linkage, adjustments can be made by changing the mixing rate polarity (+ or –).*
- When setting a VR, tap the Fine tuning "--" item and tap the screen to call the selection screen, and then select the VR. The VR operation mode can be selected.
- A mixing curve can be set.
  (For a description of the curve setting method, see the description at the back of this manual.)
Rudder → Aileron  [Corresponding model type]: Airplane/glider, general

This function is used when you want to mix the ailerons with rudder operation. It is used when rudder is applied during roll maneuvers, knife edge, etc. of stunt planes. It can be used to bank scale models, large models, etc. like a full size plane.

- A mixing curve can be set.
- Mixing during flight can be turned ON/OFF by setting a switch. (Always ON at [--] setting)
- Linking can be set: Link this mix to other mixes.
- The mixing rate can be fine-tuned by setting a VR.

Select [Rudder→Aileron] at the model menu and call the setup screen shown below.

Return to Model menu

- Mixing curve setting (For a description of the setting method, see the description at the back of this manual.)

Activate the function by tapping the [INH].

Condition group/single mode selection (Gr./Sngl)
The ON/OFF switch of mixing is chosen.

To set linking, tap to the [OFF] item

Setting method
- Tap [INH]. (ON is displayed.)
- When setting a switch, tap to the [-] item of the switch and tap the screen to call the selection screen. Then, select the switch and set its ON direction. (Always ON at "--" setting) (For a description of the switch selection method, see the description at the back of this manual.)
- When setting a VR, tap to the Fine tuning "--" item and tap the screen to call the selection screen and then select the VR. The adjustment rate can be set. The VR operation mode can also be set. (For a description of the fine tuning VR setting method, see the description at the back of this manual.)
- A mixing curve can be set. (For a description of the curve setting method, see the description at the back of this manual.)
- When linking: tap the [Link] item. (ON is displayed.)

Fine tuning setting

Left/right overall adjustment at Rate A and Rate B

Currently selected condition name

The VR operation mode can also be set.

138  < Model menu (Airplane/Glider/Multicopter Functions) >
Rudder → Elevator

[Corresponding model type]: Airplane, general

This function is used when you want to mix elevator operation with rudder operation. It is used to correct undesirable tendencies when rudder is applied in roll maneuvers, knife edge, etc. of acrobatic planes.

- A mixing curve can be set.
- Mixing during flight can be turned ON/OFF by setting a switch. (Always ON at [--] setting)

- Select [Rudder→Elevator] at the model menu and call the setup screen shown below.

- Return to Model menu

Mixing curve setting
(For a description of the setting method, see the description at the back of this manual.)

- Link can be set: Links this mixing to other mixings.
- The mixing rate can be fine-tuned by setting a VR. (Fine tuning)

Setting method

- Tap [INH].
  (ON is displayed.)
- When setting a switch, tap to the [--] item of the switch and tap the screen to call the selection screen. Then, select the switch and set its ON direction. (Always ON at "--" setting)
  (For a description of the switch selection method, see the description at the back of this manual.)
- When setting a VR, tap the Fine tuning "--" item and tap the screen to call the selection screen and then select the VR. The adjustment rate can be set.
  The VR operation mode can also be set.
  (For a description of the fine tuning VR setting method, see the description at the back of this manual.)
- A mixing curve can be set.
  (For a description of the curve setting method, see the description at the back of this manual.)
- When linking: tap the [Link] item. (ON is displayed.)
Butterfly

[Corresponding model type]: Glider, 2 ailerons or more

This function allows powerful brake operation by simultaneously raising the left and right ailerons and lowering the flaps (camber flap, brake flap).

This setting will allow the ailerons to be raised while the flaps are simultaneously lowered. Butterfly (crow) produces an extremely efficient landing configuration by accomplishing the following:
1. Slow the aircraft’s velocity.
2. Provide washout at the wing tips to reduce the tendency to tip stall.
3. Create more lift toward the center of the wing allowing it to fly at a slower speed.

- Select [Butterfly] at the model menu and call the setup screen shown below.

<table>

</table>

- Mixing during flight can be turned ON/OFF by setting a switch. (Always ON at [—] setting)
- The butterfly operation reference point can be offset. When the screen is tapped with the offset item selected when operated to the position to be changed, the reference point is offset. If the reference point is offset too much, unexpected operation may be performed.
- The ailerons and flaps operation speed can be adjusted. (In side/Out side)
- A delay can be set for each condition. A cut switch which can turn OFF the delay function can also be set.
- The differential rate can be adjusted.

*When servo binding occurs when setting the ailerons and flaps in butterfly mixing, use the AFR function to adjust the rate.
*The display screen is an example. The actual screen depends on the model type.

<table>
<thead>
<tr>
<th>When using this function, Tap [INH]. (ON is displayed.)</th>

**Overall adjustment by Rate A and Rate B**

---

< Model menu (Airplane/Glider/Multicopter Functions) >  141
These functions call the ailerons, elevators, and flaps (camber flaps, brake flaps) trim offset rates preset according to the flight state.

The amount of ailerons, elevator, and flaps (camber flap, brake flap) trim offset can be set to a switch.

As an example Trim mix 1 can be set up for launching, with speed flaps and ailerons dropped, and a slight amount of up elevator. Trim mix 2 can be used for high speed flying, with both ailerons and speed flaps reflexed slightly, and a bit of down elevator.

The trim functions can be activated during flight by setting a switch. To prevent sudden trim changes when switching flight conditions, a delay can be set to provide a smooth transition between the two. Trim mix 2 will have priority over Trim mix 1.

**Example**

1. Move to the [INH] item. Set the trim mix function to [ON].
   *When separating the settings for each condition, move to the [Group] item and set it to [Single].

2. Select the ON/OFF switch.

   In the [Auto] mode, also select an auto SW. This switch can be linked to a stick, etc.

   **<Speed>**
   - In: The operation speed at switch ON can be set.
   - Out: The return speed at switch OFF can be set.

   **<Fine Tuning>**
   - The offset rate can be varied in the Fine Tuning numeric range set at screen by VR, etc. selection.

   **<Condition Delay>**
   - When flight conditions are set, the operation speed can be set for each condition. Condition delay operation can be interrupted and each rudder quickly returned to its original position by selecting a cut switch.

*The display screen is an example. The actual screen depends on the Model Type.

---

*Return to Model menu*
Snap roll

This function selects the switch and rate adjustment of each rudder, (aileron, elevators, or flaps) when a snap roll is performed.

- Four snap roll directions can be set. (Right/up, right/down, left/up, left/down)
- Operation mode: When [Master] mode is selected, the Snap Roll function is turned ON/OFF by master switch in the state in which the direction switch was switched to the direction in which you want to snap roll. When [Single] mode is selected, snap roll in each direction can be executed by means of independent switches.
- A safety switch can be set. As a safety measure, the switch can be set so that snap roll is not executed when, for instance, the landing gear is lowered, even if the switch is turned on accidentally. The snap roll switch is activated only when the safety switch is ON.
- The operation speed of the aileron, elevator, and flap servos can be adjusted for each snap roll direction. (In side/out side)

- Select [Snap roll] at the model menu and call the setup screen shown below.

(Example) Setting example for F3A

- Mode: [Master]
- Safety SW: [SW-G] (Safety measure)
- Master SW: [SW-H] (Main switch for executing snap roll)
- Direction switches:
  * The snap roll up side left and right down side left and right direction switches are selected here.
  - Right/Up: [SW-D] OFF-OFF-ON
  - Right/Down: [SW-D] ON-OFF-OFF
  - Left/Up: [SW-A] OFF-OFF-ON
  - Left/Down: [SW-A] ON-OFF-OFF
- Speed adjustment
  The operation speed of each control surface when the snap switch is ON can be changed and snap roll executed by stick while there is switch operation can be performed.
Air brake

This function is used when an air brake is necessary when landing or diving, etc.

The preset elevators and flaps (camber flap, brake flap) offset amount can be activated by a switch.

The offset amount of the aileron, elevator, and flap servos can be adjusted as needed. Also the speed of the aileron, elevator, and flap servos can be adjusted. (In side/Out side) A delay can be set for each condition, and a Cut switch which will turn OFF the delay can be chosen. Trim amounts can be fine-tuned by setting a VR. You can also set the Auto Mode, which will link Airbrake to a stick, switch, or dial. A separate stick switch or dial can also be set as the ON/OFF switch.

*The display screen is an example. The actual screen depends on the Model Type.

Select [Air brake] at the model menu and call the setup screen shown below.

When using this function, Tap [INH]. (ON is displayed.)

The ON/OFF switch of air brake is chosen.

Manual/Auto mode selection
Manual: Switches the function ON/OFF by switch
Auto: Air brake function call can be linked to a stick, etc. A stick switch, etc. separate from the function ON/OFF switch is set.

### Condition delay setting and cut switch setting.

Offset: The ailerons, flaps, and elevators offset rate can be adjusted. Tap to the corresponding setting item. Adjust the rate.

Fine tuning: When a fine tuning VR is set on the next page, the ailerons', 'flaps', and elevators' trim rates can be adjusted. Tap to the corresponding setting item. Adjust the rate.

The value inside the parentheses shows the current rudder position.

Return to Model menu

144 < Model menu (Airplane/Glider/Multicopter Functions) >
Gyro

This function is used when a GYA Series gyro is used to stabilize the aircraft's attitude. The sensitivity and operation mode (Normal mode/GY mode) can be switched with a switch.

- Three rates (Rate 1/Rate 2/Rate 3) can be switched.
- Up to 3 axes (Gyro/Gyro 2/Gyro 3) can be simultaneously controlled.

*Initial setting does not assign a sensitivity channel. Use the Function menu of the Linkage menu to assign the sensitivity channel (Gyro/Gyro2/Gyro3) used to a vacant channel beforehand.

Set [Control] and [Trim] other than Function to [--].

- Select [Gyro] at the model menu and call the setup screen shown below.

Tapping this will change INH to either ON or OFF and enable operation. Adjustment of the three rates (sensitivity) and switching between Normal and AVCS is possible.

- Return to Model menu

The operation mode (AVCS/NOR) and sensitivity of the 3 axes Gyro/Gyro2/Gyro3 can be set.

- Three rates (Rate 1/Rate 2/Rate 3) can be used.
  Tap to the [Rate] item. Adjust the rate.
- When using this function, Tap [INH].
- When a Futaba GYA gyro is used, when [GY] type is selected, the sensitivity set value is directly read in both the AVCS and Normal modes.
- When setting a switch, tap the Switch item and tap the "--" button to call the selection screen, and then select the switch and set its ON direction.
  (For a description of the switch selection method, see the description at the end of this manual.)
Setting three axis using a GYA430 and GYA431 (2)

- Wing type: Aileron 2 servos mounted fuselage selected
- Set 5CH → Gyro (GYA431AIL), 7CH → Gyro2 (GYA431ELE), 8CH → Gyro3 (GYA430RUD), Control and Trim → "--" : of the Function menu of the Linkage menu.
- Gyro setting of the Model menu.

<table>
<thead>

</table>

*Set so that Rate 1 is turned on at the back position of switch E and Rate 3 is turned ON at the front position. Since switch E is turned OFF at the center, Rate 2 remains [INH].

AVCS
GAIN 0%
NORMAL

When AVCS is used we recommend that the sensitivity CH be set to the 3-position.
This function improves the operating performance of the roll axis by operating the elevators as ailerons.

Ailevator is where each elevator in a standard (conventional) or v-tail moves independently, like ailerons on a wing. In addition to each elevator side moving up and down together, each side moves in opposite directions when moving as an ailevator. On a V-tail, this is also known as a ruddervator, as they can serve the same purpose. Typically, both ailevator and ailerons are coupled together to maximize roll performance, especially on larger wingspan planes.

Note: Select ailevator as the Model type at the Model type screen. This changes the output channel. Check the Function menu.

- Select [Ailevator] at the model menu and call the setup screen shown below.

* If the mixing direction is reversed by the linkage, adjustments can be made by changing the mixing rate polarity (+ or -).
* If a large value of travel is specified, when the sticks are moved at the same time, the controls may bind or run out of travel. Decrease the travel until no binding occurs.
**Acceleration**

[Corresponding model type]: Glider, general

Acceleration setting can be performed at Elevator, Elevator → Camber and Aileron → Rudder. (Glider only)

- This setting is divided into elevator setting and camber setting. The setting method is the same.
- Camber setting sets the acceleration function for Elevator to camber mixing. Setting is not performed when Ele to camber mixing is INH.
- The acceleration function can be set for both the up side and down side.
- Function ON/OFF switch setting is performed for Aileron→ Rudder setting only.
- Aileron→ Rudder setting is acceleration function setting for Aileron→ Rudder mixing. It is not performed when Aileron→ Rudder mixing is INH.
- Select [Acceleration] at the model menu and call the setup screen shown below.

### Setting method

- Acceleration rate setting (Rate)
- The return time after operation (Damping) can be set.
- The operation point at acceleration and deceleration can be set. When an operation point is exceeded, acceleration is performed.

Note: When using the acceleration function, since the servo stroke is large, make your settings so there is no binding of your linkage.
This function lets you set the operation speed when the motor of a F5B or other EP glider is started by switch. The operation speed can be set in 2 ranges of slow speed flight and high speed flight (Speed 1/Speed 2). This function can also be operated as a safety function by setting 2 switches.

- The in side and out side operating speeds can be adjusted independently in 2 ranges (Speed 1/Speed 2).
- The boundary between the 2 ranges can be set. (From speed 1 to speed 2)

Select [Motor] at the model menu and call the setup screen shown below.

- When using this function, Tap [INH].
- Group/single mode switching
  (For more information, see the description at the back of this manual.)
- Switch
  A switch that turns the function itself ON/OFF can be selected.
- Motor off position
  Tap the motor off button when [SW-G] is in the motor OFF position you want to set. The direction of the motor switch is memorized. The screen graph display OFF direction also changes.

- The set operation speed operation can be activated at initial operation only. (1 time operation) However, operation can be repeated by setting the switch to OFF before operation is finished. When you want to reset 1 time operation, set the ACT/INH item to [INH] and then reset it to [ON].
- The motor (CH3) is controlled by SW-G. (Initial setting) When changing the switch or stick which controls the motor, first change Function of the Linkage menu.

Note: When using this function, always check initial operation with the propeller removed.

Notes
- First decide the motor OFF direction, and then set the speed. When you want to reset the motor OFF direction, also reset the speed.
- We recommend that motor OFF be set in combination with F/S.
- Set the basic operation direction with the reverse function to match the ESC used.
- Always set the motor OFF position.
**V-Tail**

[Corresponding model type]: Airplane/glider, Tail type V-tail

This function lets you adjust for left and right rudder angle changes at elevator and rudder operation of a V-tail airplane.

V-tail is when 2 servos are used together to control rudder movement as elevators. In addition to each rudder side moving up and down together, each side moves in opposite directions when moving as elevators. On a V-tail, this is also known as a ruddervator, as they can serve the same purpose.

- Select [V-Tail] at the model menu and call the setup screen shown below.
- Return to Model menu

---

**Condition group/ single mode selection (Gr./Sngl)**

<table>
<thead>
<tr>
<th>Elevator (Rudder 2)</th>
<th>Rudder (Elevator 2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Down</td>
<td>Up</td>
</tr>
<tr>
<td>+50</td>

<tr>
<td>+50</td>
<td>+50</td>
</tr>
</tbody>
</table>

(Elevator function) Up and down travel adjustment at CH1 and CH2 elevator operation

(Rudder function) Left and right travel adjustment at CH1 and CH2 rudder operation

- Travel adjustment
  Tap to the item you want to adjust. Adjust the rate by "▼▼" "▼" "▲" "▲▲" button.

*If the mixing direction is reversed by the linkage, adjustments can be made by changing the mixing rate polarity (+ or -).

*If a large value of travel is specified, when the sticks are moved at the same time, the controls may bind or run out of travel. Decrease the travel until no binding occurs.
Winglet

This function adjusts the left and right rudder angles of airplanes with winglets.

Winglets are used to improve the efficiency of aircraft lowering the lift-induced drag caused by wingtip vortices. The winglet is a vertical or angled extension at the tips of each wing.

Winglets work by increasing the effective aspect ratio wing without adding greatly to the structural stress and hence necessary weight of its structure - an extension of wing span would also permit lowering of induced drag, though it would cause parasitic drag and would require boosting the strength of the wing and hence its weight - there would come a point at which no overall useful saving would be made. A winglet helps to solve this by effectively increasing the aspect ratio without adding to the span of the wing.

Select [Winglet] at the model menu and call the setup screen shown below.

- Travel adjustment
  Tap to the item you want to adjust.
  Adjust the rate by "▼▼" "▼" "▲" "▲▲" button.

*If the mixing direction is reversed by the linkage, adjustments can be made by changing the mixing rate polarity (+ or -).
This section contains information on the commands that apply to helicopters only. For instructions on airplane, glider and multicopter, refer to the sections pertaining to those aircraft.

Use the Model type function in the Linkage menu to select the swash type matched to the fuselage beforehand.

Also, add flight conditions at the Condition Select screen if necessary before setting the model data at each function. (Up to 8 conditions can be used)

The AFR function, dual rate function and other functions common to all model types, are described in a separate section.

**Condition hold**

When performing adjustments, such as idling up, when the engine is engaged, keep the throttle stable so as to prevent the engine from revving too high. Once your adjustments are complete, always make sure to set the function to [OFF].

*Condition hold ON/OFF operation is possible under normal conditions and the throttle stick is more than 1/3rd into the slow throttle range. Throttle servos will remain at the throttle stick position during ON operation.*

**ON/OFF operation on the Home screen**

Under the conditions described above, tap the Condition hold [OFF] displayed on the screen. During function operation, Condition hold will display [ON] and an alarm will sound.

---

**Model menu (Helicopter) functions table**

- **Pitch curve**: Pitch curve and hovering trim adjustment
- **Throttle curve**: Throttle curve and hovering trim adjustment
- **Acceleration**: Allows a brief "overload" in response to sudden throttle and pitch commands
- **Throttle hold**: Moves the throttle to idle during autorotation
- **Swash mixing**: Compensates for each control response
- **Throttle mixing**: Compensates for power loss when cyclic applied
- **Pitch → Needle**: Adjusts response curve in different flight conditions
- **Pitch → Rudder**: Handles torque changes from pitch angle inputs
- **Gyro**: Used to switch gyro sensitivity
- **Governor**: Used to switch RPM of the helicopter’s head

---

*The Model menu screen depends on the model type.*
Pitch curve / Pitch trim

**Pitch curve**
This function adjusts the pitch operation curve for each flight condition for the optimal flight state relative to movement of the throttle stick.

*Up to 17 points can be set for the point curve types. However, when using the 3 points or 5 points specified to create a curve, a simple curve can be created by reducing the number of input points to 3 or 5, and then entering the specified value at the corresponding points that you created.

- Select [Pitch curve] at the model menu and call the setup screen shown below.
- Return to Model menu

![Graph of pitch curve](image)

- **Normal curve adjustment**
  - For normal curve, usually use [Point] type and create a basic pitch curve centered about hovering. Use this function together with the THR curve (normal) function and adjust the curve so that up/down control is best at a constant engine speed.

- **Idle up curve adjustment**
  - For the high side pitch curve, set the maximum pitch which does overload the engine. For the low side pitch curve, create curves matched to loop, roll, 3D, and other purposes and use the idle up curves according to the performance.

- **Throttle hold curve adjustment**
  - The throttle hold curve is used when executing auto rotation dives.

---

**Operation precautions**

⚠️ **WARNING**

- When actually starting the engine and flying, always set the idle up condition switch to OFF and start the engine in the idling state.
Setting method

- Group/Single item: When you also want to input the same setting contents at other conditions, perform setting in the group mode. In this case, the same contents are input to the other conditions set in the group mode. When you want to set each condition independently, select the single mode (initial setting). Other conditions can be set independently.

Curve setting examples

The screens shown below are curves created by entering the pitch rate at low, center, and high side (3 points or 5 points) at each condition. When actually creating a curve, input the rate specified at the fuselage (or the reference value).

- Pitch Curve (Example)

*For a description of the curve setting method, see the description at the back of this manual.
Pitch trim (Hovering pitch, high pitch, low pitch)

The hovering pitch, low pitch, and high pitch trim setup screen can be called from the Pitch curve setup screen.

Hovering pitch trim

The Hovering Pitch trim function trims the pitch near the hovering point. Normally, it is used with the hovering condition. The hovering pitch can be fine tuned for changes in rotor speed accompanying changes in temperature, humidity, and other flight conditions. Adjust the hovering pitch so that rotor speed is constant. This function can be used together with the hovering Throttle Trim function for more delicate operation.

Setting method

- When using only the hovering (normal) condition, switch the group mode to the single mode (initial setting) before setting.
- Tap [INH]. (ON is displayed.)
- Select the adjustment knob.
  Selection example: LD
- The trim operation mode (Mode: Center/Normal) can be selected.
  Center mode: Maximum amount of change near center by center trim operation (recommended)
  Normal mode: Normal trim (parallel movement trim) operation. The advantage of using this mode is that the hovering pitch can be adjusted without changing the curve.
- Trim adjustment range (Range) setting
  When this value is made small, trim can only be used near the center.
- The trim rate can be adjusted and the operation direction can be changed.

High Pitch/Low Pitch Trim

High Pitch/Low Pitch Trim is the pitch servo high side and low side trim function.

Setting method

- When setting the adjustment knobs common to all the conditions, set them in the group mode.
- Tap [INH]. (ON is displayed.)
- Select the adjustment knobs.
  Selection example: LS (high side), RS (low side)
- The trim rate can be adjusted and the operation direction can be changed.
- Trim acts as high side or low side trim with the center as the standard.

Return to Model menu
Throttle curve / Throttle Hover trim

**Throttle curve**

This function adjusts the throttle operation curve for each condition for optimum engine speed to throttle stick movement.

Up to 17 curve points can be set for the point curve type. However, when the 5 points and other point data is used, a simple curve can be easily created by reducing the number of input points of the curve to 5 and entering the specified value at the corresponding points.

- Select [Throttle curve] at the model menu and call the setup screen shown below.

- Return to Model menu

Normal curve adjustment

Normal curve creates a basic curve centered around hovering. Use it along with the normal pitch curve and adjust so that up/down control at a constant engine speed is easiest.

Idle up curve adjustment

Set an idle up curve that maintains a constant speed at all times, even during operation which reduces the pitch performed in flight. Create a curve matched to loop, roll, 3D, or other purposes and the idle up curve according to the performance.

Setting method

- Group/single item: When you want to simultaneously enter the same settings to other functions, make the settings in the group mode. In this case, the same setting contents are entered to the all conditions. When you want to set each condition independently, make the settings after selecting the single mode (Initial setting).

Operation precautions

⚠️ **WARNING**

When actually starting the engine and flying, always set the idle up condition switch to OFF and start the engine in the idling mode.
Curve setting examples

The curves shown below are created by using the point curve type and inputting the data of the 5 points 0% (low side), 25%, 50% (center), 75%, 100% (high) side at each condition. They are created by reducing the number of points on the line to 5. When actually creating a curve, enter the data specified per the aircraft (or the reference value).

*For a description of the curve creation method, see the description at the back of this manual.

**Throttle Curve (Example)**

Normal Curve  |  Idle-up 1 Curve  |  Idle-up 2 Curve

Throttle Hover trim

The Throttle Hover trim setup screen can be called from the Throttle curve setup screen.

- Select the adjustment knob.
- The trim operation mode (Mode: Center/Normal) can be selected.
  - Center mode: Maximum rate of change near center by center trim operation (recommended)
  - Normal mode: Normal trim (horizontal movement trim) operation.
- Trim adjustment range (Range) setting
  - When the value is made small, trim acts only near the center.
- The trim rate can be adjusted and the operation direction can be set.

Setting method

- When using the hovering (normal) condition only, switch the group mode to the single mode (initial setting) and make the settings.
- Tap [INH]. (ON is displayed.)

The Throttle Hover function trims the throttle near the hovering point. Normally, use it with hovering conditions. Changes in rotor speed accompanying changes in the temperature, humidity, and other flight conditions can be trimmed. Adjust the throttle so that rotor rotation is most stable. More delicate trimming is also possible by using this function along with the Hover Pitch function.

Throttle servo speed setting

(For a description of the setting method, see the description at the back of this manual.)

Return to Model menu
Acceleration

This function is used to adjust the pitch and the throttle rise characteristic at acceleration/deceleration operation. An acceleration function which temporarily increases the pitch and throttle operations at throttle stick acceleration/deceleration operation can be set.

**Example of acceleration function use**
- When used at pitch, the acceleration function is effective when you want to quicken the response of the fuselage at 3D flight flip, etc.
- When used, high pitch temporarily exceeds maximum pitch, but immediately returns to maximum pitch.

- Select [Acceleration] at the model menu and call the setup screen shown below.

The return time after operation (Damping) can be set.
(First return) 1 ~ 100 (Slow return)
(Acceleration doesn’t function as 0.)

**Setting method**
- Acceleration can be set at both setting at acceleration (high) and setting at deceleration (low).
  (The operation point is displayed on a graph.)
- Acceleration rate setting (Rate)
- The return time after operation (Damping) can be set.
- The operation point at acceleration and deceleration can be set. When an operation point is exceeded, acceleration is performed.
  Note: When using the acceleration function, since the pitch stroke is large, make your settings so there is no binding of your linkage.
Throttle hold

This function sets the throttle cut position for auto rotation. The throttle position can also be set to an idling position. Setting of these 2 positions can be selected by switch. This allows use for switching during training.

- Select [Throttle hold] at the model menu and call the setup screen shown below.

**Example of use**

- Since throttle hold has 2 modes (Cut) and (Idle), using it in the idling mode during training and in the Cut mode when stopping the engine at contest, etc. is convenient.

Note: When throttle hold is set to ON in the normal condition, throttle hold acts and the throttle servo is deactivated. Always set throttle hold to ON in the hold condition.

**Setting method**

- **Operation mode selection**
  
  Manual mode (Manual): The throttle hold function is operated by switch operation only.
  
  Auto mode (Auto): The throttle hold function operation is linked to the throttle stick position.
  
  Auto position setting: When the auto mode is selected, the throttle position (auto position) can be selected. Move the throttle stick to the position you want to set and tap the screen. (Auto position is displayed.)

- **Hold position adjustment**
  
  Throttle Hold (Cut) sets the throttle cut position. Adjust it so that the carburetor is full close.
  
  Throttle Hold (Idle): Make this adjustment to maintain idling for training. Adjustments can be made based on the throttle curve idle position.

- The throttle servo operating speed can be adjusted. (Speed)
- Throttle cut or training function can be switched by hold function selector switch.

**Operation precautions**

⚠️ WARNING

⚠️ When starting the engine, confirm that the idle up condition and throttle hold condition are OFF.
Swash mixing

The swash mix function is used to correct the swash plate in the aileron (roll) direction and elevator (cyclic pitch) corresponding to each operation of each condition.

Adjustment by independent curve for aileron, elevator, and pitch operations is possible. The operation can be smoothly adjusted by calling up the “Curve setup” screen by tapping the mixing item that corresponds to the mixing and direction which needs correction.

- Select [Swash mixing] at the model menu and call the setup screen shown below.

![Swash mixing setup screen]

**Example of use**

- As an example, use swash mixing to correct undesirable tendencies in the roll direction.
- For a condition which uses Aileron to Elevator, set this function to ON. When raising the nose at a right roll, when the Rate B side is input and the right aileron is operated, the elevator moves to the down side. Tune by adjusting the Rate. For right roll, adjust to the rate A side.

**Setting method**

- When using this function, tap [INH]. (ON is displayed.)
- When you want to set the same contents at other conditions, select the group mode. When you want to set the selected condition only, select the single mode (initial setting).
- The correction rate can be set by curve.
- A switch can be set.
  When [--] is set, the swash mixing function is operated by merely selecting the condition.
  When setting an [ON]/[OFF] switch, tap to the [--] item and tap the screen to call the selection screen and set the switch and its ON position.

160  < Model Menu (Helicopter Functions) >
Throttle mixing

This function corrects slowing of engine speed caused by swash plate operation during aileron or elevator operation. The method of applying clockwise or counterclockwise torque when pirouetting can also be corrected.

An acceleration function which temporarily increases the throttle side correction rate relative to rapid stick operation can also be set.

- Select [Throttle mixing] at the model menu and call the setup screen shown below.
- Return to Model menu

![Throttle mixing setup screen]

When correction is necessary, tap to the mixing item corresponding to the mixing that needs correction and tap the screen to call the curve setup screen, and then correct the slowing.

<table>
<thead>
<tr>
<th>Setting example</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Aileron to Throttle applies a load to the engine and corrects slowing of the engine speed when the aileron stick was operated. Engine racing can be adjusted independently at the right aileron and left aileron by Rates A and B.</td>
</tr>
</tbody>
</table>

"CTRM" : The correction rate maximum when the throttle stick is centered.
"Linear" : Correction applied for the entire throttle range.

Setting method

- When using this function, Tap [INH]. (ON is displayed.)
- When you want to set the same contents at other conditions, select the group mode.
  When you want to set the selected condition only, select the single mode (initial setting).
- The correction rate can be set by curve.
- A switch can be set.
  When [--] is set, the swash mixing function is operated by merely selecting the condition.
  When setting an [ON]/[OFF] switch, tap to the [--] item and tap the screen to call the selection screen and set the switch and its ON position.

<Acceleration function setting>

- Acceleration can be set for both settings (Left) and (Right)
- Acceleration rate setting (Rate)
- The return time (Damping) after operation can be set.
- The operation point (Act position) when the correction rate is increased and decreased can be set independently. When an operation point is exceeded, acceleration operation is performed.
Pitch → Needle

This mixing is used when the engine is equipped with needle control or other fuel-air mixture adjustment. A needle curve can be set.

An acceleration function which temporarily increases needle operation at throttle stick.

- Select [Pitch→Needle] at the model menu and call the setup screen shown below.

**Setting method**
- When using this function, Tap [INH]. (ON is displayed.)
- When you want to set the same contents at other conditions, select the group mode.
  - When you want to set the selected condition only, select the single mode (initial setting).
- A needle curve can be set.
- A switch can be set.

When [-] is set, the mixing function is operated by merely selecting the condition.
When setting an [ON]/[OFF] switch, tap to the [-] item. Tap the screen to call the selection screen and set the switch and its ON position.

Acceleration/deceleration operation can be set. The rise characteristic of the needle servo at acceleration and deceleration operation can be adjusted.

**Mixing curve setting**
*For a description of the curve setting method, see the description at the back of this manual.

**< Acceleration function setting>**
- Acceleration can be set at both setting at acceleration (high) and setting at deceleration (low).
- The acceleration rate (rate) and the return time after operation (damping) can be set.
- An operation point (Act position) at acceleration and deceleration can be set. When an operation point was exceeded, acceleration operation is performed.
Pitch → Rudder (Revolution mixing)

Use this mix when you want to suppress the reaction torque generated by main rotor pitch and speed changes during pitch operation. Adjust so that the nose does not move in the rudder direction.

An acceleration function which temporarily increases the correction rate at throttle stick acceleration/deceleration operation can be set. The mixing rate at acceleration/deceleration can be set.

Select [Pitch—Rudder] at the model menu and call the setup screen shown.

Mixing curve setting
*For a description of the curve setting method, see the description at the back of this manual.

Setting method
- When using this function, Tap [INH]. (ON is displayed.)
- When you want to set the same contents at other conditions, select the group mode.
  When you want to set the selected condition only, select the single mode (initial setting).
- A mixing curve is set.

<Normal condition mixing curve>
The mixing curve rate starts from a small value.
For a rotor with a clockwise operation direction (polarity), when pitch was operated at the plus side, set so that mixing is in the clockwise direction. First, trim at hovering and then adjust the neutral position.

1. Adjustment between slow and hovering
   Repeatedly hover from take off and land from hovering at a constant rate matched to your own rhythm, and adjust the pitch so the nose does not deflect when the throttle is raised and lowered.

2. Throttle high side (climbing and diving from hovering)
   Repeat climbing and diving from hovering at a constant rate matched to your own rhythm and adjust the pitch so that the nose does not deflect when the throttle is raised and lowered.

However, when a GY Series or other heading hold gyro is used, since correction is performed by the gyro, this mix is not used. If this function is used when the gyro operation mode is the AVCS mode, the neutral position will change.

<Idle up condition mixing curve>
Set the mixing rate so that the rudder direction at high-speed flight is straight ahead. Adjust for each condition used.

<Acceleration function setting>
- Acceleration operation can be performed for both setting at acceleration (High) and setting at deceleration (Low).
- Acceleration rate setting (Rate)
- The return time after operation (Damping) can be set.
- An operation point (Act position) at acceleration and deceleration can be set independently. When an operation point was exceeded, acceleration operation is performed.
Gyro [Helicopter]

This function is used to adjust gyro sensitivity. The sensitivity and operation mode (Normal mode/AVCS mode) can be set for each condition. The gyro sensitivity can be switched with each condition or the switch. (3 sensitivities)
*Compatible with 3 axis gyro (CGY750).

Setting method
- When using this function, Tap [INH]. (ON is displayed.)
- When you want to set the same contents at other conditions, select the group mode. When you want to set the selected condition only, select the single mode (initial setting).
- Three rates can be switched for each condition. (Rate 1/Rate 2/Rate 3)
- A fine tuning VR can be set.

Note: [Gyro] [Gyro2] [Gyro3] Default function
[Gyro]: CH6 (FASSTest12CH) CH5 (Other system type)
[Gyro2]: CH9
[Gyro3]: CH10
Always set to [--] both (control) and (trim) for the [Gyro] function at the Function menu in the Linkage menu.

<table>
<thead>
<tr>
<th>Rate</th>
<th>Gyro (RUD) setting</th>
<th>Gyro2 (AIL) setting</th>
<th>Gyro3 (ELE) setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Normal 80</td>
<td>Normal 50</td>
<td>Normal 50</td>
</tr>
<tr>
<td>2</td>
<td>Normal 80</td>
<td>Normal 50</td>
<td>Normal 50</td>
</tr>
<tr>
<td>3</td>
<td>Normal 80</td>
<td>Normal 50</td>
<td>Normal 50</td>
</tr>
</tbody>
</table>

Tapping these will pull up the detailed selection screen for each.
- Rate1 Gyro type and gain
- Rate2 Gyro type and gain
- Rate3 Gyro type and gain

When using Rate2/Rate3, make it INH → ON or OFF.

Condition group/single mode selection (Gr./Sngl)

The ON/OFF switch of gyro is chosen.

3 rate (gyro gain) adjustment

Use this when you want to adjust sensitivity via VR, etc., and not on-screen data entry. Tap “-”, select "VR", etc., and then tap the value to adjust. (Won't operate when value is "0").

Note: [Gyro] [Gyro2] [Gyro3] Default function

- CH6 (FASSTest12CH)
- CH5 (Other system type)
- CH9
- CH10

Always set to [--] both (control) and (trim) for the [Gyro] function at the Function menu in the Linkage menu.

Setting method
- When using this function, Tap [INH]. (ON is displayed.)
- When you want to set the same contents at other conditions, select the group mode. When you want to set the selected condition only, select the single mode (initial setting).
- Three rates can be switched for each condition. (Rate 1/Rate 2/Rate 3)
- A fine tuning VR can be set.
Usage example #1: Using gyro for only the rudder and adjusting sensitivity for each condition

* Gyro gain channel
  Gyro : CH5
  For the FASSTest12CH, Gyro/RUD is 6ch. The gyro sensitivity adjustment connector connects to 6ch.

- Select [Gyro] at the model menu and call the setup screen.

Tapping here will let you select either Normal or AVCS.

This is all that is needed for use in this case.

Because the sensitivity is switched (5ngl) per condition, Rate 2 and Rate 3 are not used.

Set gain of a rudder

Because sensitivity changes for hovering and idleup, perform switchover for each condition and adjust sensitivity.

Usage example #2: Using 3-axis gyro CGY750 and adjusting sensitivity for each condition

* Gyro gain channel
  Gyro  RUD : CH5   For the FASSTest12CH, Gyro/RUD is 6ch.
  Gyro2 AIL : CH9
  Gyro3 ELE : CH10   For the CGY750, simply connect the S.BUS; functions do not need to be set.
                     (For the FASSTest12CH, change Gyro/RUD to 6ch.)

- Select [Gyro] at the model menu and call the setup screen.

Tapping here will let you select either Normal or AVCS for each of the three axes.

This is all that is needed for use in this case.

Because the sensitivity is switched (5ngl) per condition, Rate 2 and Rate 3 are not used.

Set gain of a rudder

Set gain of an aileron

Set gain of an elevator

Because sensitivity changes for hovering and idleup, perform switchover for each condition and adjust sensitivity.
Governor

When using a Futaba governor, this function is used to switch the RPM of the helicopter's head. Up to 3 rates can be set for each condition.

* The governor is used by connecting the governor speed setting channel to CH7 (initial setting).

* When using an independent governor [ON]/[OFF] switch, connect the AUX([ON]/[OFF]) connector of the governor to CH8 (initial setting) and set the switch to CH8 (Governor2) at the Function menu of the Linkage menu.

* When using the Fuel Mixture function, the mixture servo is controlled from the governor. When transmitting the mixture curve data from the transmitter to the governor, the governor AUX (m.trm) connector must be connected to CH8 (initial setting) and governor side setting performed. See the governor instruction manual.

Note: Always set (Control) and (Trim) to [--] for [Governor] and [Governor 2] of the Function menu of the Linkage menu.

- Select [Governor] at the model menu and call the setup screen shown below.

- Return to Model menu

Setting method

- **Activate the mixing**
  When using this function, Tap [INH]. (ON is displayed.)

* When the function is set ON/OFF at the governor setup screen, the governor rpm setting channel end point servo travel and limit point are now initialized.

* When changed from INH to ACT (ON), the servo travel is initialized to 100 and the limit point is initialized to 155.

* When operation is changed to INH at all conditions, the servo travel is initialized to 100 and the limit point is initialized to 135.

* When using the Fuel Mixture function, the mixture servo is controlled from the governor. When transmitting the mixture curve data from the transmitter to the governor, the governor AUX (m.trm) connector must be connected to CH8 (initial setting) and governor side setting performed. See the governor instruction manual.

Note: Always set (Control) and (Trim) to [--] for [Governor] and [Governor 2] of the Function menu of the Linkage menu.

- **RPM adjustment**
  Tap to the rate item. Adjust the rpm by ▼▼▼▼ ▲▲▲▲ button.
  Initial value: 50% (1500rpm)
  Range: OFF, 0~110% (OFF, 700~3500rpm)

* When the value is tapped reset to the initial value.

- **Unit display selection**
  Tap to the UNIT item [%] [rpm]. Select the unit.
**Display mode selection**

* When [rpm] mode is selected above setting, the display mode can be selected.
* There is no change in the transmitter output even when the "Mode" is changed. Calibration should be performed via the governor.
* In order to use the Governor function of the T18SZ, it is necessary to change the settings on the governor for the low side 700 rpm mode.

When the Mode of the Governor screen's model menu is changed, the change is also indicated on-screen.

**Fine tuning VR settings**

Tap to the [-] item and tap the screen to access the selection screen. Select the control.

* For a description of the switch selection method, see the description at the back of this manual.

Tap to the rate item.
Adjust the trim rate by "▼ " "▼ " "▲ " "▲ " button.
Initial value: 0% (0rpm)
Adjustment range: -20~+20%

* When the screen is tapped for one second, the sensitivity is reset to the initial value.

Tap the screen to return to the cursor mode.
This section describes the functions often used at the function setup screen. Refer to it when setting each function.

**Operations value setting**

Tapping the value setting buttons each screen will cause value input buttons to appear at the top of the panel.

Pressing and holding a value will return it to its default setting.

---

**Common operations used in function setup screen**

When setting multiple flight conditions, linking the setting contents with all conditions (group mode) or setting independently (single mode) can be selected. The mode can be changed at the [Gr] item on each setup screen.

**Group/single mode switching (Gr/Singl)**

- **Group mode (Gr)**
  The same setting contents are set to all the flight conditions.

- **Single mode (Singl)**
  Set this mode when the setting contents are not linked with other conditions.

**Condition delay setting**

Unnecessary fuselage motion generated when there are sudden changes in the servo position and variations in the operating time between channels can be suppressed by using the condition delay function of the condition select function [Condition select].

When the delay function is set at the switching destination condition, a delay corresponding to that amount is applied and the related functions change smoothly.

**Setting method**

1. Switch to the condition you want to set and tap the delay [0 (value)].
2. Set the delay by " " " " " " button.
   Initial value: 0
   Adjustment range: 0~27 (maximum delay)
   (When the value is tapped, the delay is reset to the initial value.)
Operations related to fine tuning VR

[Setting method]
1. Control selection
   Tap the [Control] "--" button to call the <Hardware select> screen, and then select
   the switch and its ON direction.

2. Mode selection
   Tap the [Mode] button, and then select the mode ([LIN.], [ATL+], [ATL-], or [SYM.]).

3. Rate adjustment
   Tap the [Rate] "value" button.
   Set the rate by "▼▼▼ ▼ ▼ ▲ ▲ ▲ ▲ ▲ ▲ ▲ " button.

   Initial value: 0%
   Adjustment range: -100%~+100%
   (When the value is tapped, the rate is reset to the initial value.)

[Fine tuning VR operation mode]
[LIN.] Mixing rate 0% at center of VR.
   When the VR is turned clockwise and counterclockwise, the mixing rate
   increases and decreases, respectively.

[ATL+] Mixing rate 0% at left end of VR.
   When the VR is turned, the mixing rate increases.

[ATL-] Mixing rate 0% at right end of VR.
   When the VR is turned, the mixing rate increases.

[SYM.] When the VR is turned to the left or right of the neutral position, the mixing
   rate increases.

After setting, press a HOME/EXIT button
# Operations related to servo speed

<table>
<thead>
<tr>
<th>Speed</th>
<th>Mode</th>
<th>Out Speed</th>
</tr>
</thead>
<tbody>
<tr>
<td>In</td>
<td>Linear</td>
<td>0</td>
</tr>
<tr>
<td>Out</td>
<td></td>
<td>0</td>
</tr>
</tbody>
</table>

**Servo speed setting**

The servo speed at each function operation (including flight condition switching) can be adjusted. The servos operate smoothly at a fixed speed corresponding to the set speed. The operating speed (In side) and return speed (Out side) can be set individually.

Switch the operation mode according to the set function.

- "Symmetry" mode: Used with ailerons and other self neutral functions.
- "Linear" mode: Used with functions which hold the operation position of the throttle and switch channel, etc.

**[Setting method]**

1. Select the mode ([Linear] or [Symmetry]). Each time the button is tapped, it toggles between [Linear] and [Symmetry].
2. Tap the In or Out Speed button and set the servo speed.

   - Initial value: 0
   - Setting range: 0–27

*First* 0 ~ 27 (*Slowly*)
**Curve setting operation**

This section describes the setting procedure of curves which are used with the AFR function and each mixing function.

**Curve type selection**

Three types of curves (EXP1, EXP2, Point and Spline) can be selected.

1. Tap the button of the curve type you want to use.

*The curve type changes and the display returns to the original screen.*

- [EXP1]: EXP1 curve
- [EXP2]: EXP2 curve
- [Point]: point curve
- [Spline]: spline curve
Setting by curve type

When the curve type is selected as described above, adjustment items corresponding to the curve type appear on the screen. Adjust each curve as described below.

EXP1/EXP2 curve adjustment

Using the EXP1 curve is effective in smoothing starting of the ailerons, elevator, rudder, etc.

Using the EXP2 curve is effective in engine rise and other engine control.

The curve left and right rates ([Rate A], [Rate B]) and EXP curve rate ([EXP A], [EXP B]) can be adjusted individually. ([EXP] for EXP2)

The curve can also be offset horizontally ([Offset]) in the vertical direction.

[Rate setting]
1. Tap to the [Rate A], [Rate B], [EXP A], or [EXP B] setting item.
2. Set the rate by "↑" "↓" "▲" "▲▲" button.
   Initial value: +100.0% (rate)/+0.0% (EXP rate)
   *Initial value differs depending on function.

   Adjustment range: -200.0~+200.0% (rate)/-100.0~+100.0% (EXP rate)
   (When the value is tapped, the rate is reset to the initial value.)

[Offsetting the curve horizontally in the vertical direction]
1. Tap to the [Offset] setting item.
2. Move the curve in the vertical direction by "↑" "↓" "▲" "▲▲" button.
   Initial value: +0.0%
   (When the value is tapped, the rate is reset to the initial value.)
Line and spline curve adjustment

Line curves or spline curves of up to 11/17 points can be used. (Initial value: 11/9 points) The set points can be freely increased, decreased, and offset. Curves which are symmetrical to the left and right of center can also be set.

[Adjusting the rate of each point]
1. Use the move between points buttons [ ← ] or [ → ] to select the point. (The red ■ point is the selected point.)

*The mark ■ on the curve shows the currently selected point.

2. Tap the Rate button.
3. Use the "↑" "↓" "▲" "▲▲" buttons to adjust the rate.

[Point addition method]
1. Tap the "Position" button.
2. Tap the "↑" "↓" "▲" "▲▲" button and select to the position (mark []) you want to add.

3. When the "Add" is tapped, the point is added.
   *A new point is created.

[Point deletion]
1. Use the move between points button [ ← ] or [ → ] and select the point. (The red point is the selected point.)

2. Tap the [Remove] button. (The selected point becomes an outlined point.)
3. Tap the move between point button [ ← ] or [ → ].
   *The point is deleted.

The curve can also be offset horizontally in the vertical direction.

[Offsetting the curve horizontally in the vertical direction]
1. Tap the Offset button.

2. Use the "↑" "↓" "▲" "▲▲" buttons to move the curve horizontally up and down.
   *Initial value: +0.0%

*[Separ.] mode: Normal setting
*[Comb.] mode: Creates a left and right symmetrical curve.
Switch selection method

The various functions used in the T18SZ can be selected by switch. The switch (including when stick, trim lever, or VR are used as a switch) setting method is common to all functions.

Switch selection

When a switch is selected at a mixing function, etc., the selection screen shown below is called.

When switch is selected

Switch ON/OFF setting is possible at each position.

1. When the ON/OFF "Set" position switch is tapped after the switch was selected, the screen shown below appears.

When stick, trim lever, or VR is selected.

When a stick, trim lever, or VR is used as a switch, the following 2 modes can be selected.

- **Mode**: Linear/Symmetry

1. When the ON position button is tapped after stick, etc. was selected, the screen shown below appears.

2. Select the mode you want to use, and set it as described below.
3. Close the screen by tapping [Hardware select].

*When the button of each position is tapped, it toggles between ON and OFF.
2. Tap the button and set to the ON position.
3. Close the screen by tapping [Hardware select].
Operation modes

The operation modes when stick, trim lever, or knob was selected are described below.

Linear mode

This mode sets ON/OFF at the left or right (up or down) with the set point as the reference.

Symmetrical mode

Left and right (up and down) operations are symmetrical about the neutral position. For instance, when you want to switch DR1 with the aileron stick, when the stick is moved to the left or right, DR1 can be turned on at the same left and right position.

Shifting the ON/OFF point

The ON/OFF point can be shifted. ON/OFF at a free position can be changed.

• Green range: OFF range
• Red range: ON range

[Setting method]
1. Move the stick, etc. to the point you want to shift and tap the [Set] button. The boundary points change.
Logic switch (Condition select function only)

The logic switch function lets you turn operation on and off by combining two switches. For instance, the condition is activated when 2 switches are turned on.

Logic mode

AND: When both switches are ON, the condition is ON.
OR: When either switch is ON, the condition is ON.
EX-OR: When the two switches are in different states, the condition is ON.

Switch mode selection

1. Tap to the [Mode] "Single" item.
   (Logic switch setting screen)

Switch selection

1. Select the switch A and B.

Logic mode selection

1. Tap to the [Logic] item.
2. Select the logic mode.
Updating

Your Futaba T18SZ transmitter programming can be updated easily online. When functions are added or improved, the update file can be downloaded from our website. Copy the update files to the SD card and then use the following procedure to update the program.

Check our web site for the FAQ regarding updating for more information.

Updating procedure

**Note:** If the battery fully discharges during program updating, updating will fail. When the remaining battery capacity is 50% or less, always recharge the battery before updating.

**Note:** The model data in the transmitter can be used unchanged after updating, but to be safe, back up the model data before updating.

1. Download the zip file of the update data from our website.

2. Extract the zip file on your computer.

3. The "FUTABA" folder will be created on your computer.

4. Copy the "FUTABA" folder into your SD card.

**Note:** If the SD card has already had "another FUTABA" folder before you make a copy, the "FUTABA" folder is OVERWRITTEN.

5. Insert the SD card with "FUTABA" folder that contained the update software into the SD card slot on your T18SZ radio transmitter.

6. Turn on the transmitter power while pressing down the "HOME/EXIT" button. The update screen appears on the LCD display of your T18SZ and the software update is started.
7. When the software update is completed, "Completed" message is shown on the LCD display of your T18SZ. (Show below picture.)

8. Turn off the power switch of your T18SZ and remove the SD card from the card slot.

**Possible Problems**
When one of the error messages shown below appears on the LCD screen your T18SZ, the software update will not be completed.

"Low battery."
Software update is postponed because of low battery. Retry the software update after the battery is recharged.

"Update file not found."
The T18SZ cannot find the update file on the SD card. Check to be sure all the update files have been copied onto the SD card.

"Broken file."
The T18SZ detects the update file error. The update file may be broken or for another transmitter.

"Write error."
The software update procedure is stopped for an unknown reason. Contact your local service center when this error message appears on the LCD screen of your T18SZ.

⚠️ Don't absolutely remove the battery and the SD card from the transmitter during the update.

There is a possibility that the transmitter will be damaged.

Recovering a failed update
If you failed to update for any reason, it may transmitter will not start.
In that case, please update again transmitter in the following procedure.
1. Detach the battery from the transmitter.
2. Insert the SD card that contained the update files to the transmitter.
3. Attach the battery to the transmitter while pressing down the "HOME/EXIT" button.
4. The update will start.

Even after the above steps, if the transmitter fails to update or does not start, please have it serviced.
