

REVOLVER

FUSELAGE ALIGNMENT HOLE

Step 1: The Fuselage alignment hole mentioned on page 11, step 3 under ***Finishing the Wing Panels*** is an optional step. The screw going into the fuse tube and then into the wing tube does not contribute to the structural integrity of the Revolver. It is intended to aid in the removal of the wing. If you choose to use the fuselage alignment hole with screw and you find that the hole is misaligned measure to the center of the tube in the fuse. Then insert and rotate the wing tube and re-drill the hole with a #44 drill bit (.086" or 2.19mm). Finally, insert the screw.
