IMPORTANT UPDATE

This step goes *before* step 1 on page 11, in the "Install The Engine" section.

1. Arrange the stopper and tubes as shown in the photo and then insert them into the tank. Do not tighten the screw to expand the stopper. You will do that in the next step. Be certain the fuel line weight (clunk) at the end of the fuel line inside the tank does not contact the rear of the tank, otherwise, the line may become stuck above the fuel level and stop the fuel flow. Remember which is the carb line, vent and fill tubes. You can mark the tubes with a Top Flite Panel Line Pen if you wish.
