

# HOBICO *R/C Shark*

## Product Improvement Notice

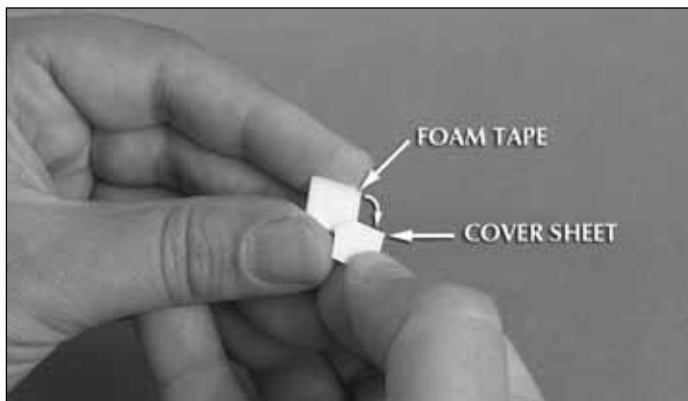

The correct front-to-rear balance on your Hobbico shark is needed for best performance. Your shark is designed to have the correct balance point right out of the box, but slight variations can occasionally occur. It is recommended that the balance of your shark be checked before use.

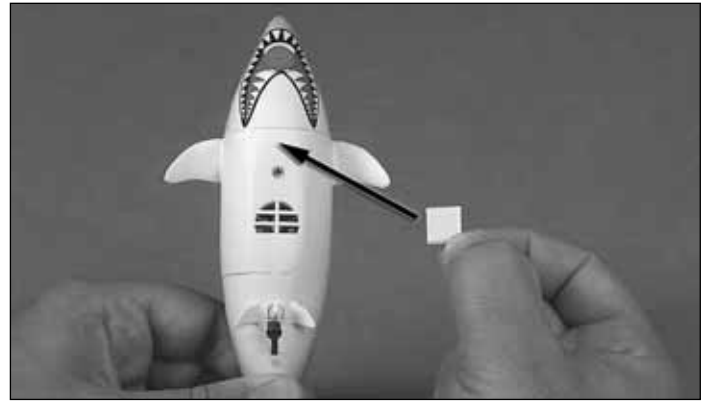

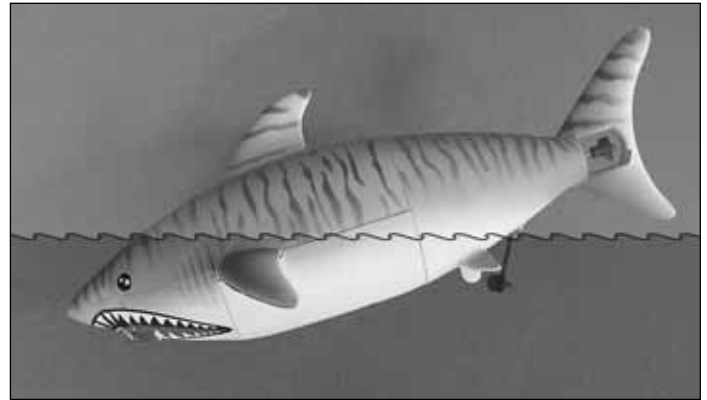

Place the shark in the water and observe how it floats. If it floats level, no additional balancing is needed. Proceed to the manual before using.

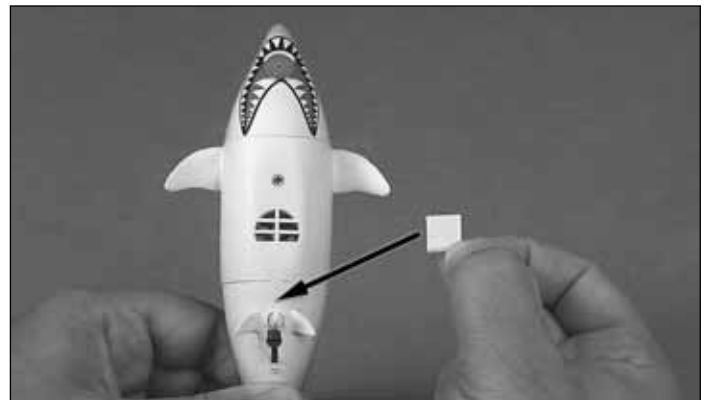

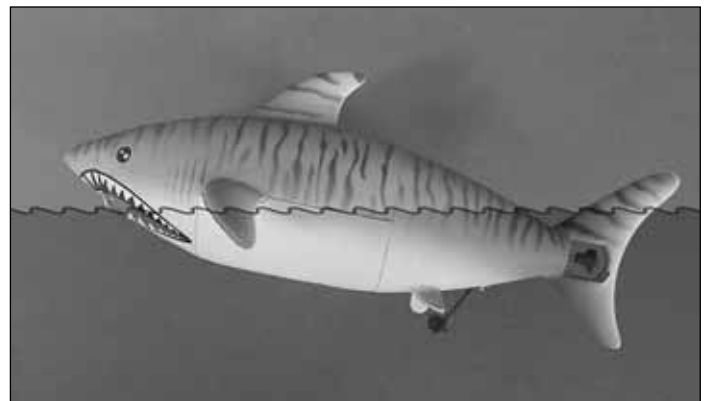

If the shark does not float level, a few easy steps are all that is required to adjust it. Cut a 10mm section from the included foam tape.

Peel the cover sheet material from the back of the foam tape.

**If the shark floats nose down:** Place the 10mm section of foam tape on the bottom of the shark just behind the "mouth".

**If the shark floats nose up:** Place the 10mm section of foam tape on the bottom of the shark just in front of the charge port.

Repeat these steps using more or less tape as needed until the shark floats level. Proceed to the manual before using.
