## ***230Si Quadcopter Tech Tip***

- When in **Limited Altitude Mode** or **Altitude Hold Mode**, the 230Si is designed to maintain power even if the throttle is briefly lowered to zero. This is designed to help smooth out altitude changes if the pilot briefly moves the throttle stick too far down by mistake. When landing in these modes, always keep in mind it will take a few seconds for the quad motors to stop rotating once you lower the throttle to zero.
- **NOTE:** In **Normal Mode**, the throttle works linear and will stop the motors immediately when the throttle stick reaches zero.
