

RISE RXS270

TECH TIPS

If the receiver antenna mount is broken in a crash, the antenna can be temporarily mounted on the back of the quadcopter with one wire running vertically on one of the frame supports.

When replacing a motor, use some thread locking compound on the screws and tighten them so they are snug. Overtightening these screws will strip the threads in the base of the motor.

Position the battery so the quadcopter will be level when supported by two fingers under the middle of the flight controller. When the CG is centered, the quad will be easier to control and the motors will have more power to accelerate and maneuver the quadcopter.
